

Projekt LIDER – stan na 10.2012

Jan Suffczyński

Kierunki badań

- Magnetoptyka (REF, MCD, MOKE, PL): $(\text{Ga},\text{Mn})\text{N}$ i $(\text{Ga},\text{Fe})\text{N}$
- Opis oddziaływania wymennego jon magnetyczny – nośnik w reżimie silnego sprzężenia
- Stałe wymiany jon-jon
- Kontrola stanu spinowego i ładunkowego Mn
- Ferromagnetyczne DMS

Półprzewodniki szerokoprzerwowe z nanoklasterami metalicznymi dla opto-elektroniki

Czas trwania: 2010 - 2013

Przedmiot badań : nanokompozyty azotkowe i tlenkowe, w tym
(Ga,Fe)N i **(Zn,Co)O**

Główne kierunki:

- Efekty magnetooptyczne, np. efekt Kerra, Faradaya
- Plazmoniczne wzmacnienie efektów magnetooptycznych i emisji
- Fotoniczne wzmacnienie efektów magnetooptycznych
- Wpływ domieszkowania Fe na emisję złącz p-n na bazie GaN

napisane, czeka na redakcję

p-n junctions with (Ga,Fe)N

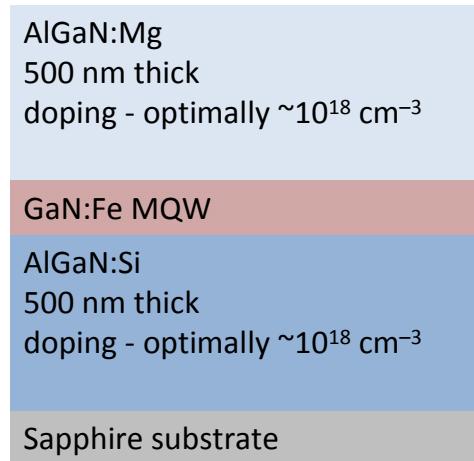

p-n 1624

p-n 1693

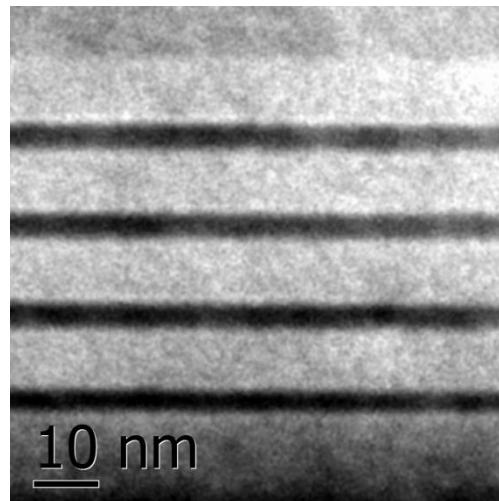

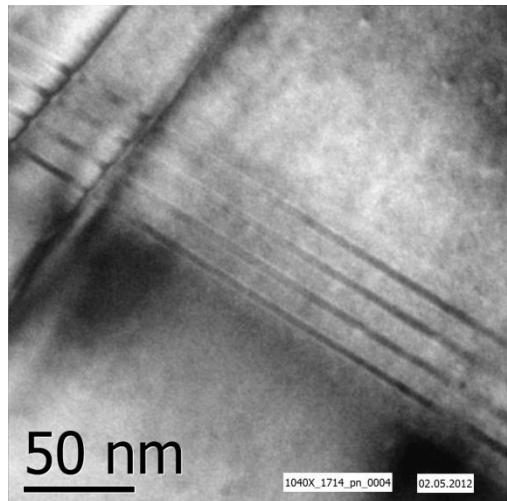

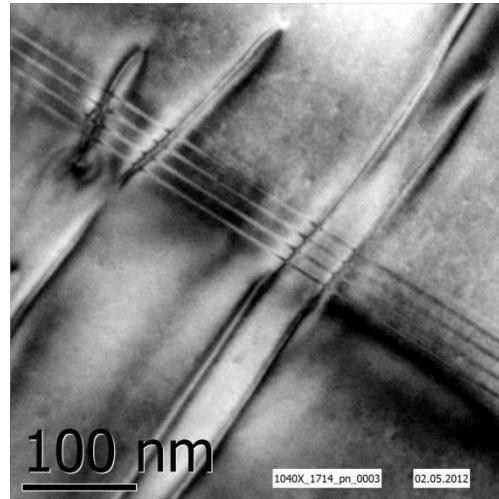

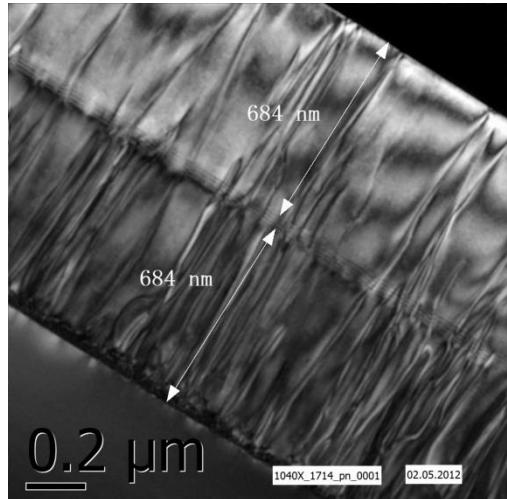

Sample 1714: AlGaN p-n junction

Close up of the active layer

TEM characterization

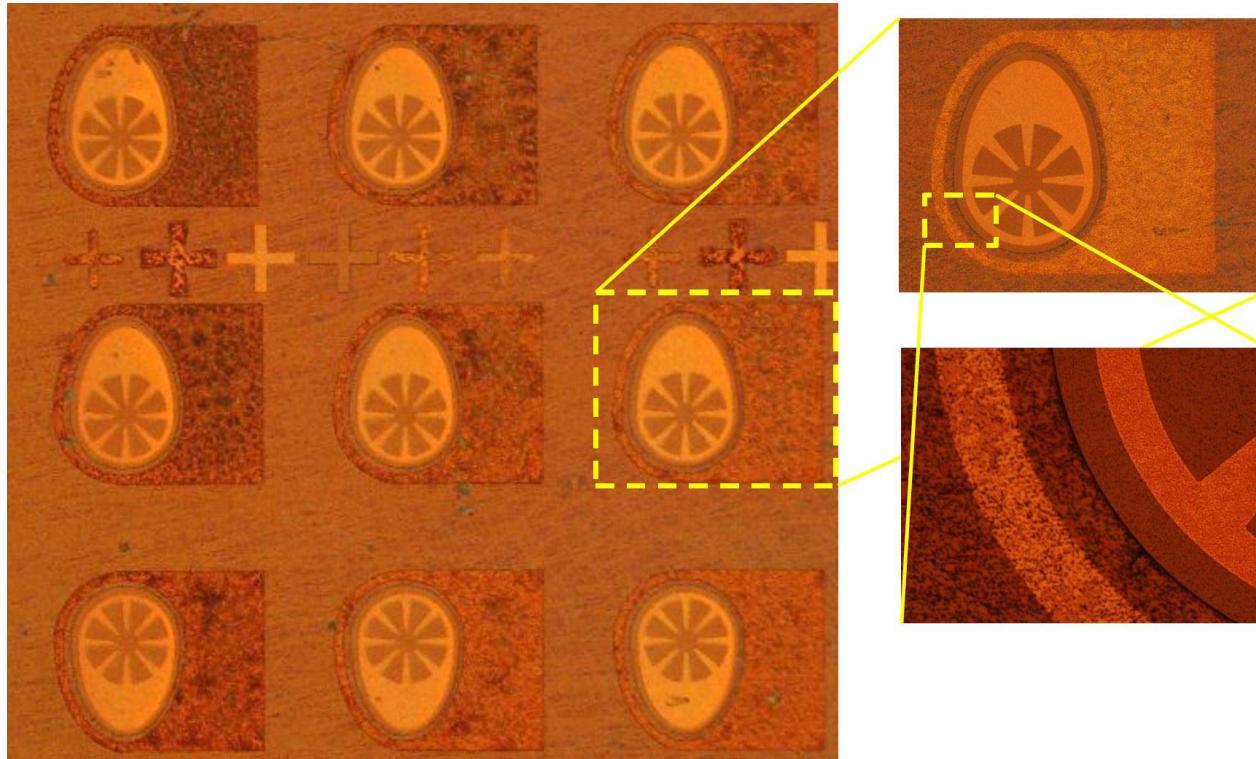

AlGaN:Mg

$\text{Al}_{0.1}\text{Ga}_{0.9}\text{N}$
GaFeN

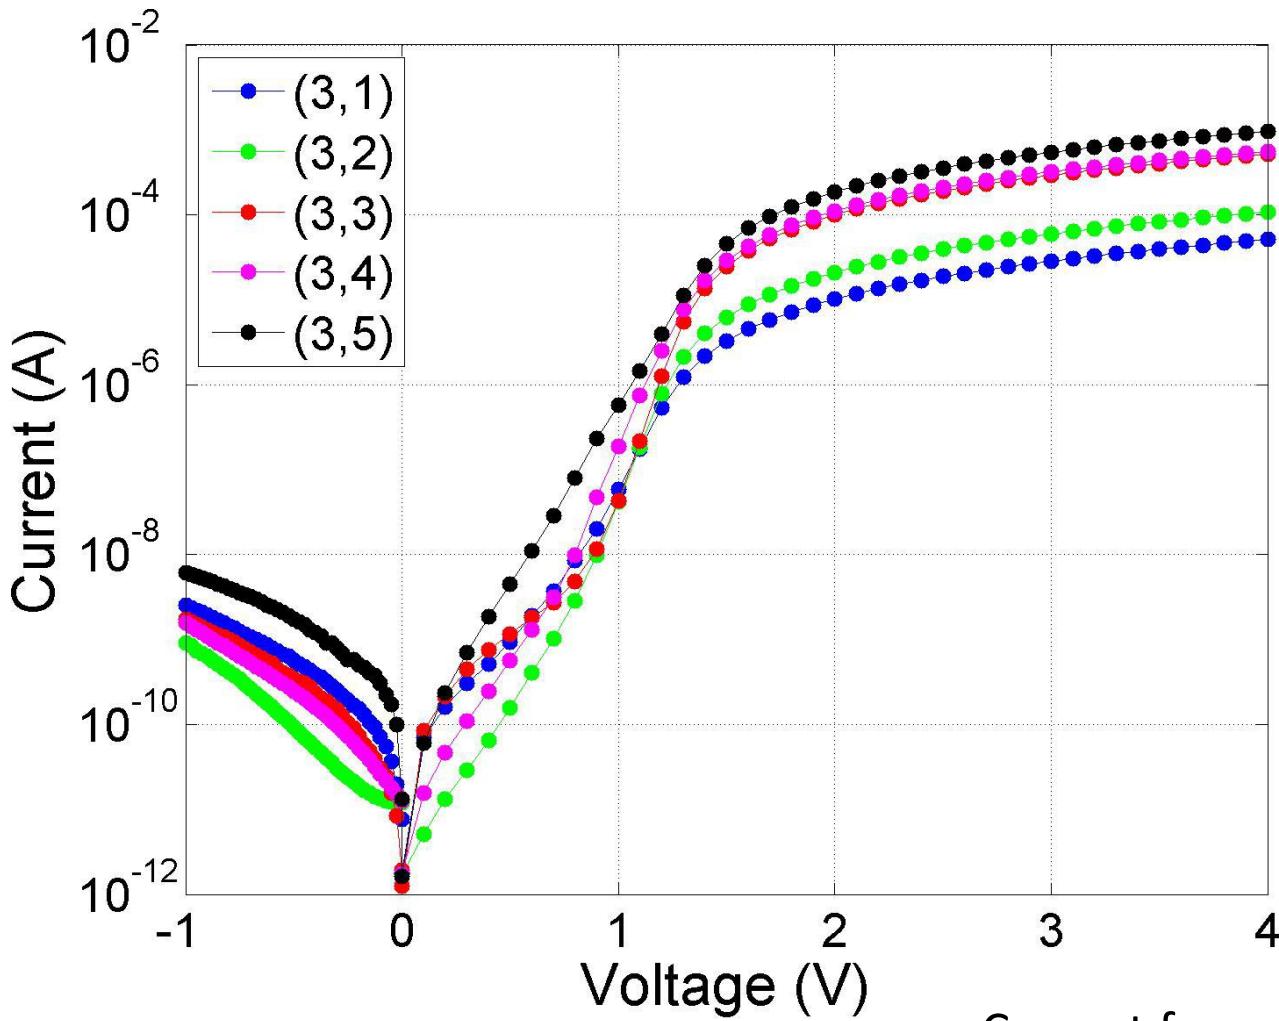

JKU, Linz
Tian Li

Sample preparation

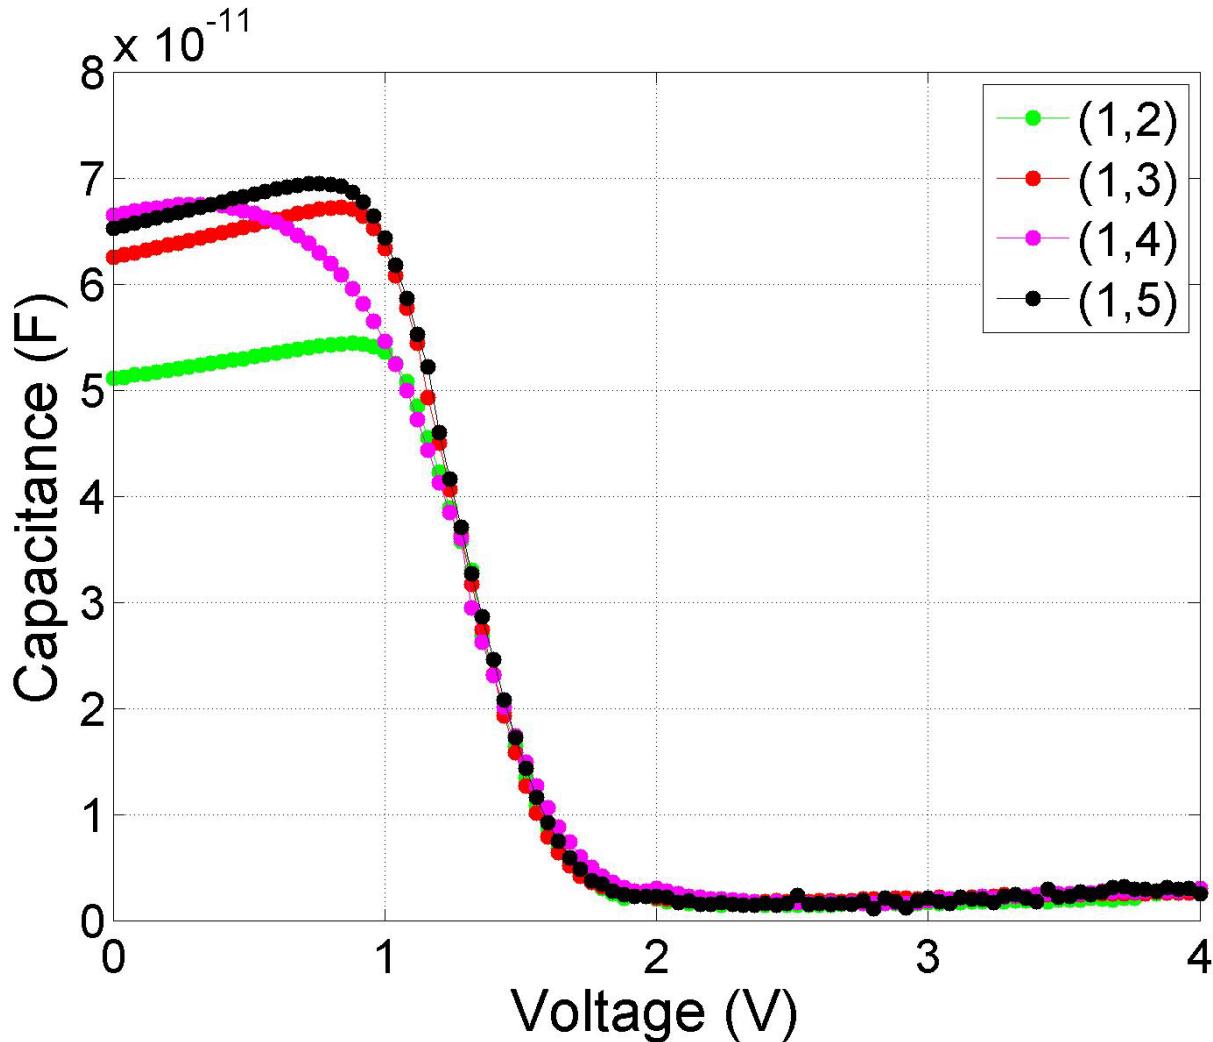

Mesas etched in ITE (M. Ekielski, K. Gołaszewska, E. Kaminska)

I-V characteristics

Current for:
forward voltage 10^{-3} A at 4V;
reverse voltage 10^{-8} A at -1V.

C-V characteristics

Information on depletion layer widths and carrier concentration?

Summary: p-n junctions

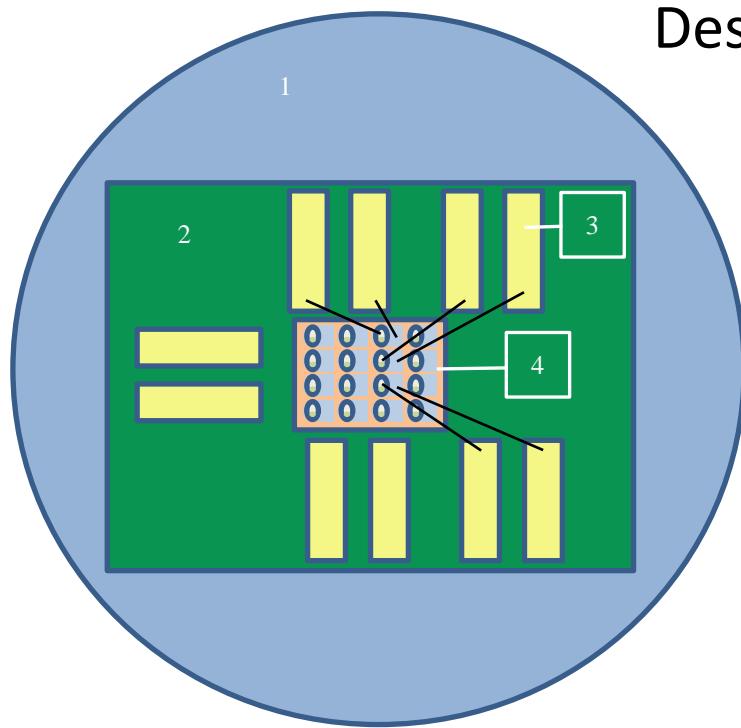

- I-V dependence as in the case of standard p-n junction
- Most of the mesas exhibit similar quantitative and qualitative dependences → homogeneity of the sample and good quality of deposited contacts

In progress:

- I-V and C-V characteristics modeling and analysis
- Bonding wires to selected, best contact pads

To do:

- Photo- and electroluminescence measurements in low temperature
- Verification of possible e-m radiation detection capabilities of the junction

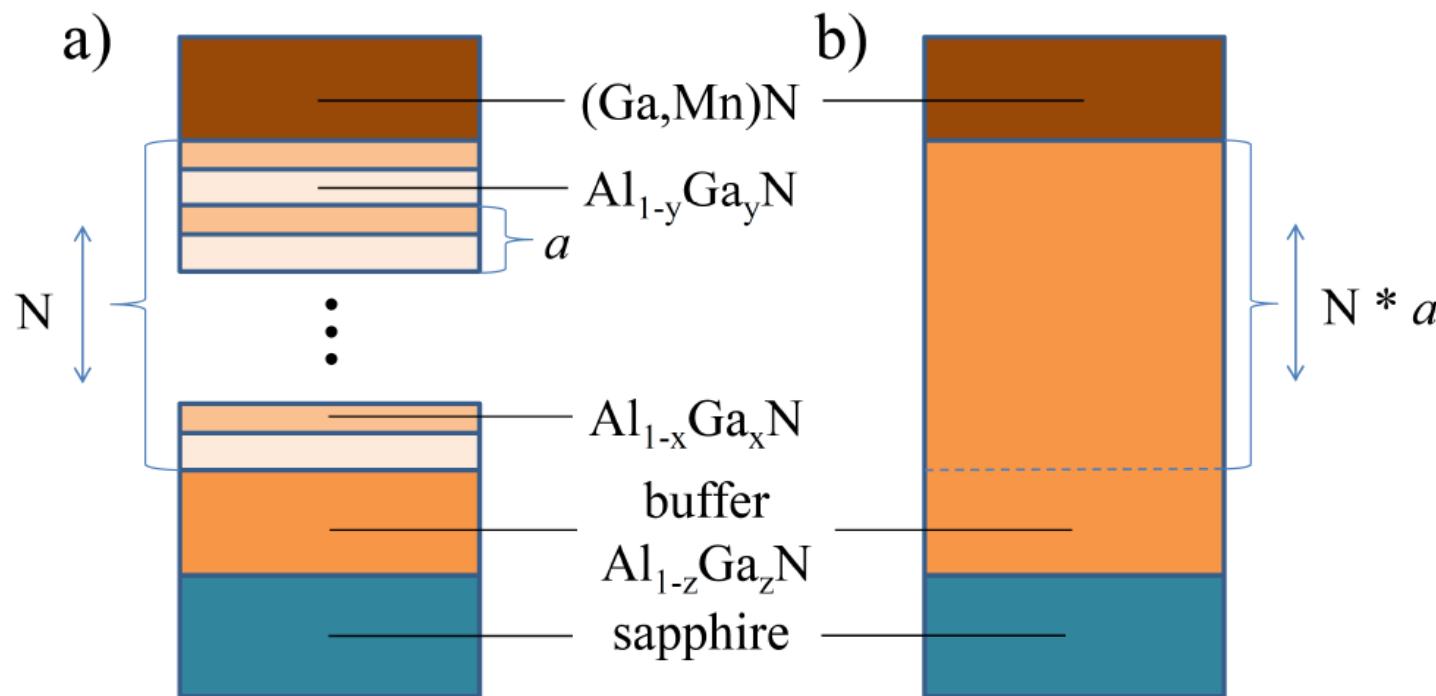

Designed contact pad

Perspective

- Spin-LED
- High carrier density in GaFeN QWs...

Photonic enhancement of Magneto-optical Kerr effect (MOKE) in $(\text{Ga,Mn})\text{N}$ i $(\text{Cd,Mn})\text{Te}$

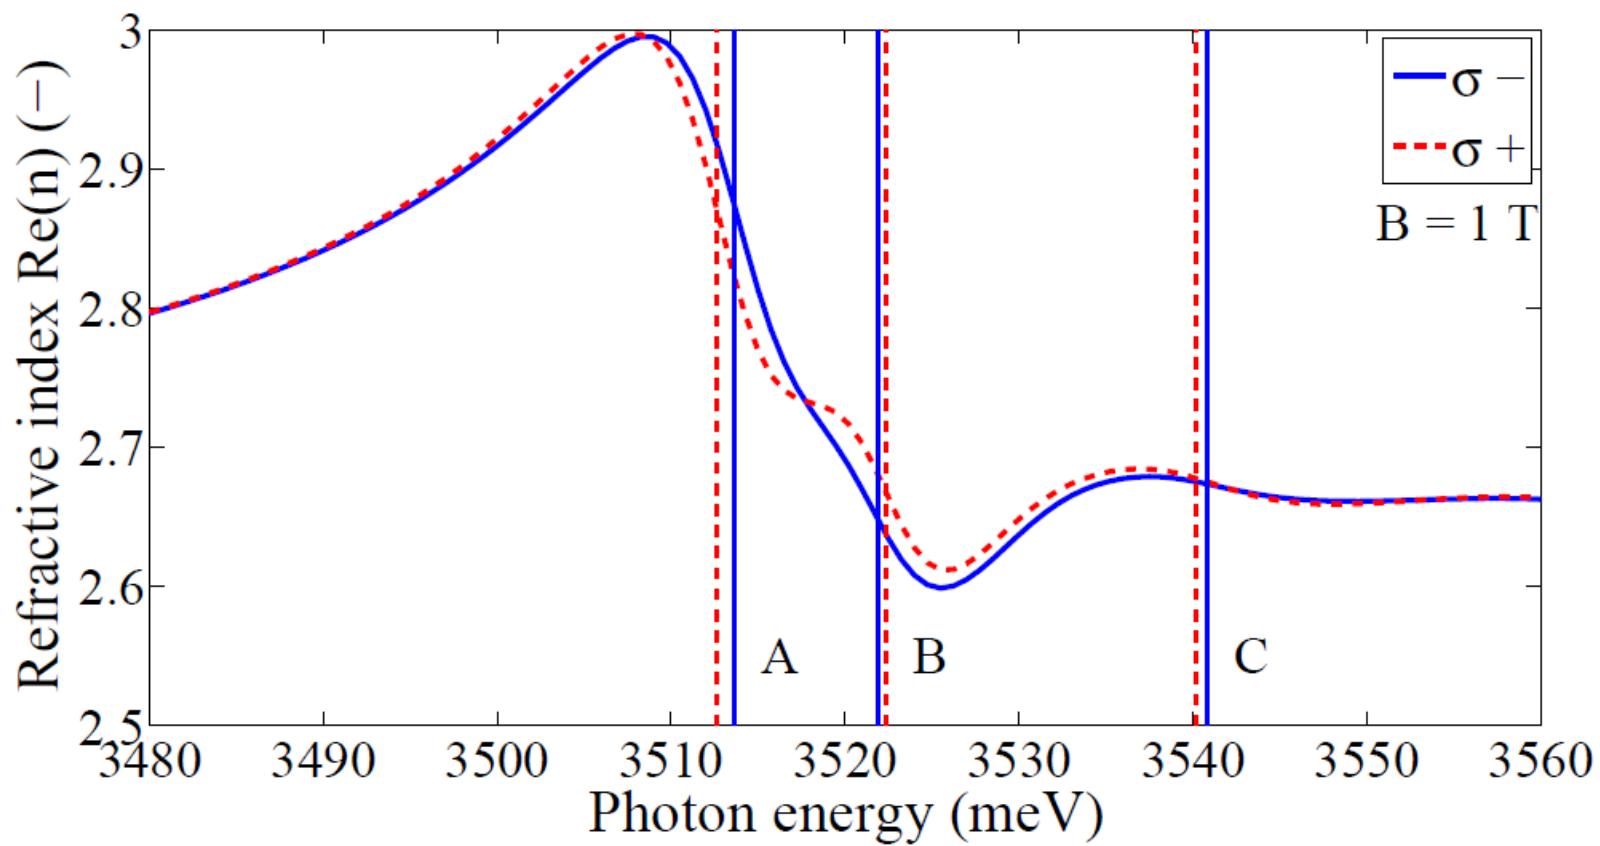

Sample design

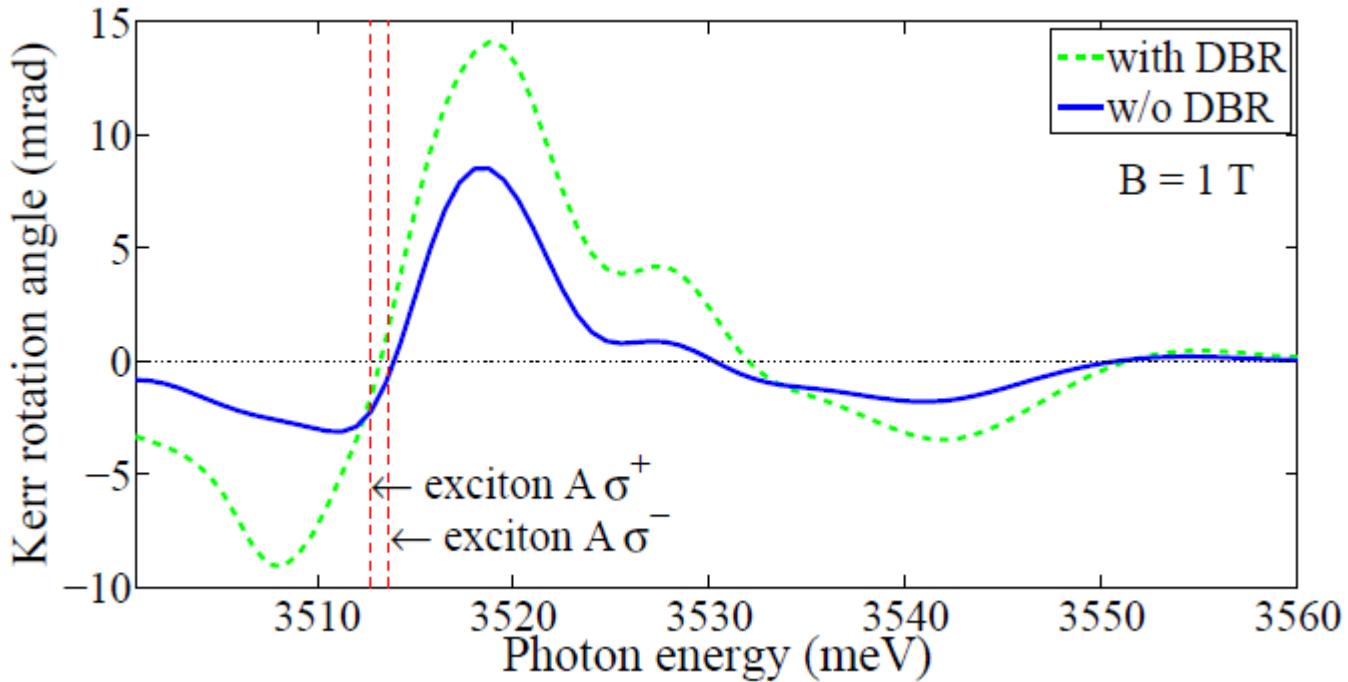

Realistic parameters assumed. E.g.:

- small contrast of refractive indices of layers constituting the DBR
- AlGaN buffer on Sapphire

Calculated GaMnN dielectric function

Calculated Kerr rotation angle GaMnN

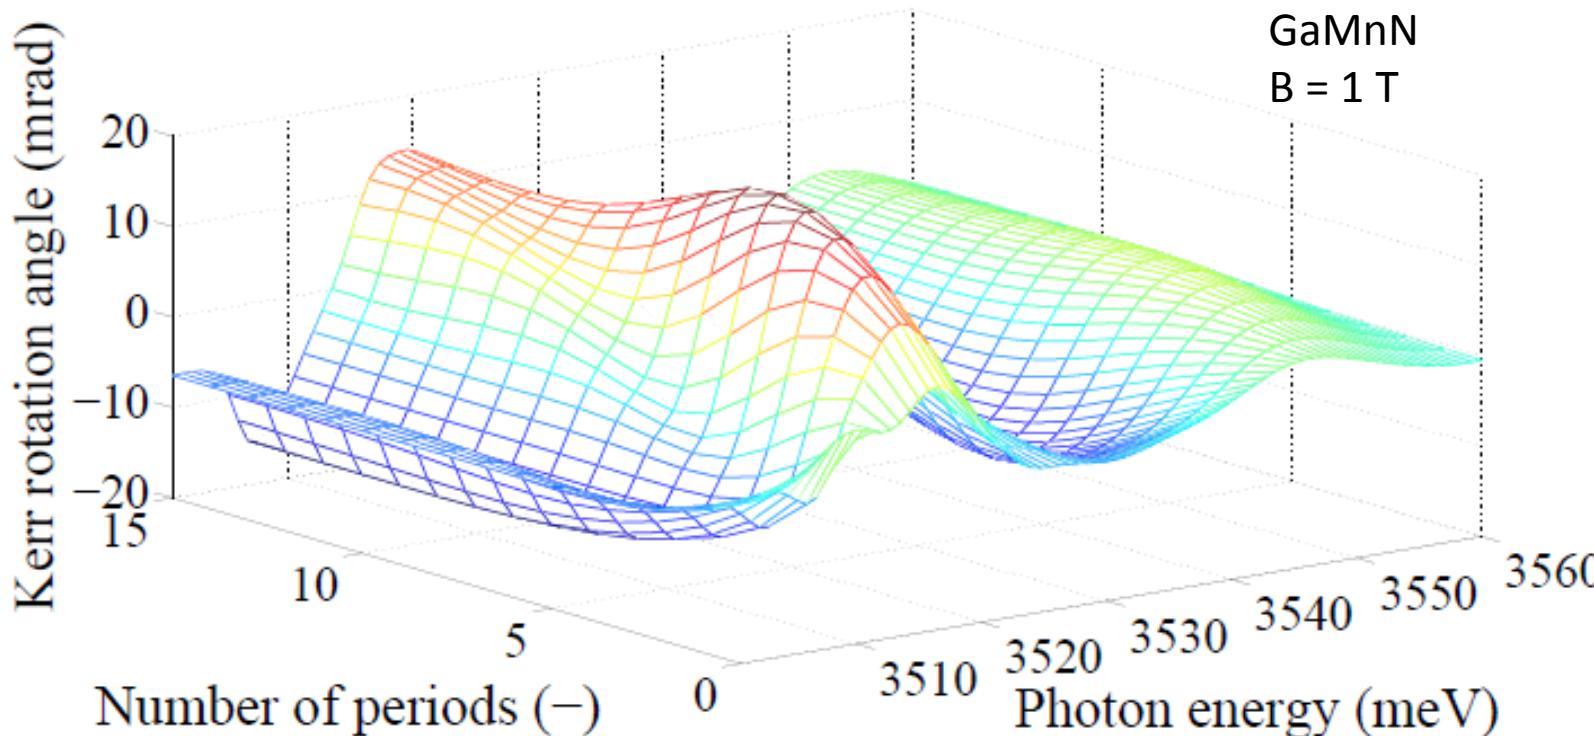

$$\Theta_K = \frac{1}{2} \arg \frac{r^-}{r^+}$$

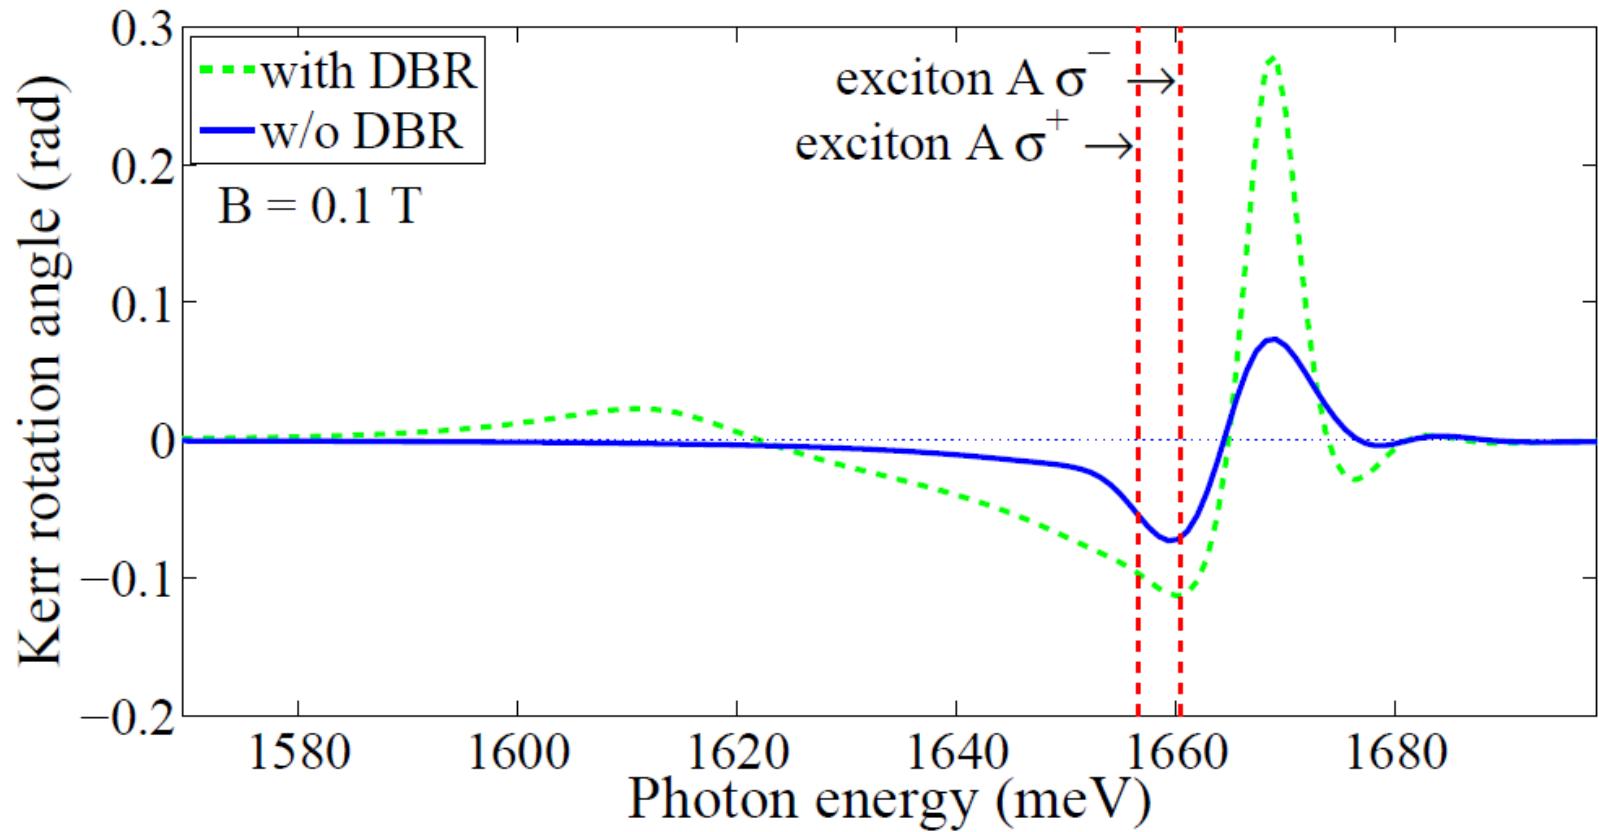

r- and r+ : complex amplitudes of reflectivity
coefficients for sigma - and sigma + circular
polarizations

MOKE amplitude enhanced

Calculated Kerr rotation angle vs number of periods in Bragg mirror

Calculated Kerr rotation angle CdMnTe

MOKE amplitude enhanced

Summary – MOKE + DBR

- a significant amplification of the magneto-optical effects even for small number of periods and low contrast of refractive indices of layers within the DBR
- broadening of the range of magnetic ion concentrations within the DMS for which MOKE could be observed
- proposed design is valid for the case of both, wurtzite III-V and zinc-blende II-VI DMS.
