SF model for general Lorentzian geometries

Florian Conrady (PI)

Main innovations of the last years

- E

 $\mathcal{A} \mathcal{A} \mathcal{A}$

《曰》《卽》《臣》《臣》

It has been shown by explicit comparison that EPRL and FK model are very similar, but ...

Question

How exactly are the master constraint and coherent state approach related?

Ξ.

590

There is a Lorentzian EPRL model, but

Geometries are restricted In the Lorentzian EPRL model all triangles are spacelike.

3d analogy

3d triangulation, where all links are spacelike.

Coupling to Maxwell field

< □ ▶

There is always a local frame in which the field is purely magnetic!

▲□ ▶ ▲ 臣 ▶ ▲ 臣 ▶

- E

~ ~ ~ ~ ~

What we found

- Simplicity constraints of EPRL can be equivalently understood in terms of conditions on coherent states.
- Using this method we extended the EPRL model to general Lorentzian 4–geometries.

< A

Transition from BF theory to gravity

Action of BF theory:

$$S = \int J \wedge F = \int \left(B \wedge F + \frac{1}{\gamma} \star B \wedge F \right)$$

Impose simplicity constraints such that B becomes

$$B=\star(E\wedge E).$$

Convenient to call the total bivector J, since it corresponds to the generator of SO(1,3) in the spin foam model.

Zakopane 2010 9 / 42

 $\mathcal{A} \mathcal{A} \mathcal{A}$

- **B**

Classical simplicity constraints

Simplicity constraint: \exists unit four-vector U such that

$$U \cdot \star B = 0$$
.

From this it follows that

$$\star B = E_1 \wedge E_2, \qquad U \cdot E_1 = U \cdot E_2 = 0,$$

or equivalently

$$B=A U \wedge N$$
, $|N^2|=1$, $U \cdot N=N \cdot E_1=N \cdot E_2=0$.

A is the area of the parallelogram spanned by E_1 and E_2 .

1

 $\mathcal{A} \mathcal{A} \mathcal{A}$

10 / 42

Classical simplicity constraints

In a discrete setting, these quantities assume the following meaning:

- $\star B$ area bivector of triangle
- E_1 , E_2 edges of triangle
 - *N* unit normal vector of triangle
 - *U* unit normal vector of tetrahedron

- E

 $\mathcal{A} \mathcal{A} \mathcal{A}$

11 / 42

I ∃ ► I ∃ ►

Classical simplicity constraints

Express B in terms of the total bivector J:

$$B = \frac{\gamma^2}{\gamma^2 + 1} \left(J - \frac{1}{\gamma} \star J \right)$$

Starting point for quantization:

$$U \cdot \left(J - \frac{1}{\gamma} \star J\right) = 0$$

Spin foam model

Zakopane 2010 35 / 42

Complex:

- simplicial complex Δ : 4-simplex σ , tetrahedron τ , triangles t, ...
- dual complex Δ^* : vertex v, edge e, face f, ...

Variables (same as in EPRL):

- connection $g_e \in SL(2, \mathbb{C})$
- irrep label $n_f \in \mathbb{Z}_+$

Additional variables:

- $U_e = (1, 0, 0, 0)$ or (0, 0, 0, 1): normal of tetrahedron dual to e
- $\zeta_f = \pm 1$: spacelike/timelike triangle dual to f

BF theory
$$A_f((\rho, n); g_{ev}) = \operatorname{tr} \left[\prod_{e \subset f} D^{(\rho, n)}(g_{ve}) \mathbb{1}_{(\rho, n)} D^{(\rho, n)}(g_{ev'}) \right]$$

 \downarrow
 $A_f((\rho, n), \zeta; U_e; g_{ev}) = \lim_{\delta \to 0} \operatorname{tr} \left[\prod_{e \subset f} D^{(\rho, n)}(g_{ve}) P_{(\rho, n), \zeta, U_e}(\delta) D^{(\rho, n)}(g_{ev'}) \right]$

Projector onto allowed irrep

The projector $P_{(\rho,n),\zeta,U_e}(\delta)$ projects onto the irreps permitted by the simplicity constraints.

Subtlety for continuous series: states not normalizable \rightarrow smearing with wavefunction required!

$$P_{s}^{\epsilon}(\delta) = \sum_{\alpha=1,2} \sum_{\pm m=\epsilon} \int_{0}^{\infty} \mathrm{d}s' \ \mu_{\epsilon}(s') f_{\delta}(s'-s) \left| \Psi_{s' \ m}^{(\alpha)} \right\rangle \left\langle \Psi_{s' \ m}^{(\alpha)} \right\rangle$$

Spin foam sum in terms of coherent states

Using completeness relations of coherent states the spin foam sum can be also written in terms of vertex amplitudes.

For example, in the case of the discrete series,

$$P_{j}^{\pm} = (2j-1) \int_{\mathrm{SU}(1,1)} \mathrm{d}g \left| \Psi_{jg}^{\pm} \right\rangle \left\langle \Psi_{jg}^{\pm} \right| = (2j-1) \int_{\mathbb{H}_{\pm}} \mathrm{d}^{2}N \left| \Psi_{j\vec{N}} \right\rangle \left\langle \Psi_{j\vec{N}} \right| \,,$$

where \mathbb{H}_\pm is the upper/lower hyperboloid.

More details soon ...

Summary of results

- coherent state derivation of EPRL constraints
 - based on correspondence between classical and quantum states
- extension of EPRL constraints to general Lorentzian geometries
 - normals of tetrahedra can be timelike and spacelike
 - triangles can be spacelike and timelike
- discrete area spectrum of timelike surfaces
- definition of associated spin foam model
- coherent states for timelike triangles (see paper)

Outlook

• Our results open the way to analyzing realistic Lorentzian geometries

- corresponding to generic discretizations of smooth geometries
- regions with timelike boundaries
- black holes?
- Extension of results on EPRL model?
 - asymptotics, graviton propagator ...?
- canonical LQG on timelike surfaces?
- comparison with previous work on timelike surfaces
