#### Abstract

We obtain an array of new results in the theory of Vaĭnberg–Brègman relative entropies and quasinonexpansive operators on reflexive Banach spaces, and we also develop an extension of this theory to nonreflexive Banach spaces, providing a joint generalisation of the reflexive approach with the finite-dimensional information geometric approach. In the reflexive case, we study generalised pythagorean inequality, as well as norm-to-norm, uniform, and Lipschitz-Hölder continuity of entropic projections, proximal maps, and resolvents. We also provide a detailed account of the family of Vaĭnberg-Brègman geometries that are naturally encoding the geometric properties of the underlying Banach space norm. The extended theory belongs to the intersection of convex theoretic and homeomorphic approaches to nonlinear analysis. Its models are constructed using integration theory on order unit spaces. Our main focus is on geometry of, and nonlinear quasinonexpansive operators on, normal state spaces of JBW- and W\*-algebras, modelled via nonlinear embeddings into reflexive rearrangement invariant spaces. For example, we analyse the extended Vainberg-Brègman geometries induced by norm geometry of noncommutative and nonassociative  $L_p$  spaces via Mazur embeddings, providing sufficient conditions for monoidal composability of extended quasinonexpansive operators, and computing the exponent parameters of Lipschitz-Hölder continuity of the corresponding extended entropic projections and resolvents. Other models feature the (commutative and noncommutative) Lozanovskiĭ factorisation map, generalised spin factors, finite dimensional base normed spaces, and convex spectral functions on unitarily invariant ideals of compact operators. We also discuss several categories of entropic projections and quasinonexpansive operators naturally appearing in this framework.

#### 1 Introduction

## 1.1 Vaĭnberg-Brègman geometry

A property of a Banach space will be said to be linear norm-geometric iff it is invariant under a linear isometry into another Banach space. For any Banach space  $(X, \|\cdot\|_X)$ , both  $\|\cdot\|_X$  and  $\|\cdot\|_X^2$  are convex functions. Various linear norm-geometric properties of a Banach space  $(X, \|\cdot\|_X)$  which quantify convexity (resp., differentiability) of its norm are dual to the corresponding linear norm-geometric properties quantifying differentiability (resp., convexity) of a norm of a Banach dual space  $(X^*, \|\cdot\|_{X^*})$ . One of the key features of nonlinear convex analysis on Banach spaces is a generalisation of these relationships from the pairs  $(\|\cdot\|_X, \|\cdot\|_{X^*})$  of Banach dual norms to the Mandelbrojt–Fenchel dual pairs  $(\Psi, \Psi^{\mathbf{F}})$  of convex functions, acting, respectively, on  $(X, \|\cdot\|_X)$  and  $(X^*, \|\cdot\|_{X^*})$ .

A special role in a passage from norm geometry to convex geometry on a Banach space  $(X, \|\cdot\|_X)$  is played by the convex functions  $\Psi_{\varphi}(x) := \int_0^{\|x\|_X} \mathrm{d}t \, \varphi(x) \, \forall x \in X$  (with  $\varphi$  positive, strictly increasing, continuous,  $\varphi(0) = 0$ , and  $\lim_{t \to \infty} \varphi(t) = \infty$ ; such  $\varphi$  is called a  $gauge)^1$ , which are generating duality mappings  $j_{\varphi}$  through their subdifferential:  $\partial \Psi_{\varphi} =: j_{\varphi} : X \to 2^{X^*}$ . The functions  $\Psi_{\varphi}$  can be seen as a generalisation of  $\frac{1}{2} \|\cdot\|_X^2$  (=  $\Psi_{\varphi}$  with  $\varphi(t) = t$ ), allowing to characterise linear norm-geometric properties of an underlying Banach space in terms of properties of  $\Psi_{\varphi}$  (instead of properties of  $\|\cdot\|_X$ ). In general, the following triad is equivalent: convexity (resp., differentiability) properties of  $\|\cdot\|_X$ , convexity (resp., differentiability) properties of  $\psi_{\varphi}$ , monotonicity (resp., continuity) properties of  $\psi_{\varphi}$  (see Proposition 2.25). Since linearity of  $\psi_{\varphi}$  for  $\psi_{\varphi}$  is equivalent with  $\psi_{\varphi}$  being a Hilbert space [151, Prop. 2],  $\psi_{\varphi}$  can be seen as a generically nonlinear map. For Banach spaces  $\psi_{\varphi}$  with Gateaux differentiable  $\psi_{\varphi}$ , the corresponding duality mappings  $\psi_{\varphi}$  are functions (i.e. singleton-valued maps), and take the particularly useful form  $\psi_{\varphi} = \mathfrak{D}^G \Psi_{\varphi} : X \to X^*$  (with  $\mathfrak{D}^G$  denoting Gateaux derivative).

In essence, the Vaĭnberg–Brègman geometry on a reflexive Banach space  $(X, \|\cdot\|_X)$  takes two further steps: moving from the specific Gateaux differentiable convex function  $\Psi_{\varphi}: X \to \mathbb{R}^+$  to any Gateaux differentiable convex function  $\Psi: X \to ]-\infty, \infty]$ , and moving from the (symmetric) metric distance  $d_{\|\cdot\|_X}(x,y) := \|x-y\|_X \ \forall x,y \in X$  to the (asymmetric) Vaĭnberg–Brègman functional [329, Eqn. (8.5)]

$$D_{\Psi}(x,y) := \Psi(x) - \Psi(y) - \left[ \left[ x - y, \mathfrak{D}^{G} \Psi(y) \right] \right]_{X \times X^{\star}} \ \forall (x,y) \in X \times \operatorname{int}(\operatorname{efd}(\Psi)), \tag{1}$$

with  $D_{\Psi}(x,y) := \infty \ \forall y \in X \setminus \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $[\![\cdot,\cdot]\!]_{X\times X^{\star}}$  denoting the Banach space duality. (Due to this asymmetry, most of objects in the Vaĭnberg–Brègman geometry exist in two, left and right, versions.) As a result, it provides an alternative setting of geometric properties on X, quantified in terms of a convex function  $\Psi$  instead of  $[\![\cdot]\!]_X$ . In particular (see Table 1):  $D_{\Psi}$  acts as an analogue of  $(d_{\|\cdot\|_X})^2$ ; left and right  $D_{\Psi}$ -projections (onto left and right  $D_{\Psi}$ -Chebyshëv sets K, respectively),

$$y \mapsto \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y) := \underset{x \in K}{\operatorname{arg inf}} \{D_{\Psi}(x, y)\} \quad \text{and} \quad y \mapsto \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y) := \underset{x \in K}{\operatorname{arg inf}} \{D_{\Psi}(y, x)\},$$
 (2)

respectively, act as analogues of metric projections (onto Chebyshëv sets K)

$$y \mapsto \mathfrak{P}_K^{d_{\|\cdot\|_X}}(y) := \underset{x \in K}{\arg\inf} \{ \|x - y\|_X \};$$
 (3)

left and right  $D_{\Psi}$ -(quasi)nonexpansive operators act as analogues of  $\|\cdot\|_X$ -(quasi)nonexpansive operators, etc. For  $(X, \|\cdot\|_X)$  given by a Hilbert space and  $\Psi = \frac{1}{2} \|\cdot\|_X^2$  one has  $D_{\Psi}(x, y) = \frac{1}{2} \|x - y\|_X^2$ , hence metric and Vaĭnberg–Brègman theories coincide in this case, but it is no longer so in more general cases. Each choice of  $\Psi$  provides a specific "probing" of the structure of a Banach space, and it also

<sup>&</sup>lt;sup>1</sup>Statements of this paragraph hold also for a more general class of *quasigauges*, defined as nondecreasing functions  $\varphi: \mathbb{R}^+ \to [0, \infty]$  such that  $\varphi \not\equiv 0$  and  $\exists s > 0 \lim_{t \to +_s} \varphi(t) < \infty$ . However, in this case, each of the geometric properties of  $\|\cdot\|_X$  requires to impose some additional conditions on  $\varphi$  (see Proposition 2.28), so it is more straightforward to discuss the key ideas of  $\Psi_{\varphi}$  while assuming that  $\varphi$  is a gauge.

<sup>&</sup>lt;sup>2</sup>Strictly speaking, the Vaĭnberg–Brègman theory on reflexive Banach spaces is a generalisation of the theory of metric projections and norm-nonexpansive operators on Hilbert spaces, and is analogous to (and is generally better behaved, see [8, §§4–5, §§7–8], than) a corresponding theory of metric projections and norm-nonexpansive operators on Banach spaces. In particular, while metric projections on Hilbert space as well as left and right  $D_{\Psi}$ -projections on reflexive Banach spaces satisfy the pythagorean theorem (see Table 1), it is not so for metric projections on reflexive Banach spaces.

establishes a particular convention of statistical inference on it (e.g.,  $\Psi = \frac{1}{2} \| \cdot \|_X^2$  corresponds to  $D_{\Psi}$ -projections encoding the optimal estimation on  $(X, \| \cdot \|_X)$  in the sense of least squares). The class of Vaĭnberg–Brègman geometries determined by  $\Psi = \Psi_{\varphi}$  provides thus an intermediate stage between the Banach space norm geometry (characterised by the properties of  $\Psi_{\varphi}$ ) and the Vaĭnberg–Brègman geometry in general. Beyond the realms of  $\Psi = \Psi_{\varphi}$ , the properties of Vaĭnberg–Brègman geometry are no longer directly related to geometric characteristics of the Banach space norm. However, it remains a rich geometric theory on its own, with a deep role played in convex nonlinear analysis on Banach spaces, since the formula (1), defining  $D_{\Psi}$ , essentially encapsulates the first order Taylor expansion of the convex function  $\Psi$  (and, thus, the knowledge about the global minimum of  $\Psi$ ).

Table 1: Comparison of elementary notions of metric geometry on a Hilbert space and Vaı̆nberg-Brègman geometry on a reflexive Banach space. Regarding interpretation of  $\left[\left[\cdot,\mathfrak{D}^{G}\Psi(\cdot)\right]\right]_{X\times X^{\star}}$  as a notion of orthogonality in a Gateaux differentiable reflexive Banach space  $(X,\|\cdot\|_X)$  for  $\Psi=\Psi_{\varphi}$ , see Remark 3.33.(xiii). Regarding the comparison of characterisations of metric projections in Hilbert and Banach spaces with characterisations of left and right  $D_{\Psi}$ -projections, including their respective continuity properties, see Remark 3.33.(iii). Second clause of the orthogonal decomposition in the Hilbert space norm case was obtained in [255, Prop. 1]. First clause of the orthogonal decomposition in the Vaı̆nberg-Brègman case was obtained in [13, Thm 3.19, Rem. 3.20] (restated as Proposition 3.9.(i)+(iii)), while the second clause is obtained in Proposition 3.9.(ii)+(iv). For  $Z \in \{\mathcal{H}, X\}$ , Fix $(T) := \{x \in Z : T(x) = x\}$ . We use a notation  $P_L^{d_{\parallel \cdot \parallel_{\mathcal{H}}}}$  for a linear subspace  $L \subseteq \mathcal{H}$ , since in such case the family  $\mathfrak{P}_L^{d_{\parallel \cdot \parallel_{\mathcal{H}}}}$  coincides with the bounded linear projection operators on  $\mathcal{H}$ .

Brègman [65, Lemm. 1] (=[66, Lemm. 1, §2.2]) and Chencov [97, Thm. 1] have independently discovered a characteristic geometric property of additive decomposition of a class of relative entropies under entropic projection onto a (suitably understood) affine (resp., convex) closed subset  $K \subseteq M$ , called a generalised pythagorean equation (resp., inequality). Chencov discovered it for  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi}}$  with  $D_{\Psi} = D_1$ , where  $D_1(\omega, \phi) := \int \mu(\phi - \omega + \omega \log \frac{\omega}{\phi})$  is the Kullback-Leibler information [210, Eqn. (2.4)] on  $M = L_1(\mathcal{X}, \mu)$ , with K given by exponential families (i.e. sets of probability densities which

are affine in exponential coordinates),

$$D_{\Psi}(\omega,\phi) = D_{\Psi}(\omega, \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\omega)) + D_{\Psi}(\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\omega), \phi) \ \forall (\omega,\phi) \in M \times K.$$
 (4)

On the other hand, Brègman discovered it for  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$ ,

$$D_{\Psi}(\omega,\phi) = D_{\Psi}(\omega, \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\phi)) + D_{\Psi}(\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\phi), \phi) \ \forall (\omega,\phi) \in K \times M, \tag{5}$$

where  $D_{\Psi}$  is a Vaĭnberg-Brègman functional, and K is a convex closed subset of  $M = \mathbb{R}^n$  (with  $D_1$ belonging to the family  $D_{\Psi}$  in the finite dimensional setting [65, p. 1021] (=[66, p. 15])). In both cases, the passage from affine to convex K implies replacing = by  $\geq$ . The generalisation of right pythagorean equation/inequality (4) to  $D_{\Psi}$  and  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  has been obtained in [240, Prop. 4.11]. Under some suitable conditions on  $\Psi$ , left (resp., right) pythagorean inequality characterises left (resp., right)  $D_{\Psi}$ -projections, see Proposition 2.8 (resp., [240, Prop. 4.11] and Proposition 3.1).

The left and right generalised pythagorean equations are a highly remarkable generalisation of the ancient equation  $a^2 + b^2 = c^2$ , as well as its cartesian and hilbertian analogues,

$$\|x - y\|_{\mathcal{H}}^{2} = \|x - P_{K}^{d_{\|\cdot\|_{\mathcal{H}}}}(y)\|_{\mathcal{H}}^{2} + \|P_{K}^{d_{\|\cdot\|_{\mathcal{H}}}}(y) - y\|_{\mathcal{H}}^{2} \,\forall (x, y) \in K \times \mathcal{H},\tag{6}$$

given the nonlinearity of  $\overleftarrow{\mathfrak{P}}_K^{D_{\Psi}}$  and  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi}}$ , as well as asymmetry and nonquadraticity of  $D_{\Psi}$ . In the information theoretic context, one can interpret  $D_{\Psi}(\omega,\phi)$  as quantification of an "information gain" (or an "uncertainty loss"), with  $D_{\Psi}(\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\phi), \phi)$  interpreted as quantification of an "information gain due to learning of constraints" and  $D_{\Psi}(\omega, \mathfrak{P}_{K}^{D_{\Psi}}(\phi))$  interpreted as quantification of an "uncertainty loss within the constraints". Analogous interpretation holds for  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$ . In other words, left and right pythagorean equations can be interpreted as a nonlinear additive decomposition of quantified information contained in "data" into "signal" plus "noise".

In general, a map  $T: K \to \operatorname{int}(\operatorname{efd}(\Psi))$  with  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi)) \subseteq X$  (where  $\operatorname{int}(\operatorname{efd}(\Psi))$  denotes an interior of a domain of finiteness of  $\Psi$  with respect to the topology of  $\|\cdot\|_{Y}$  is said to be left (resp., right)  $D_{\Psi}$ -quasinonexpansive iff

$$D_{\Psi}(x, T(y)) \le D_{\Psi}(x, y) \ \forall (x, y) \in \text{Fix}(T) \times K$$
 (7)

(resp.,  $D_{\Psi}(T(x), y) \leq D_{\Psi}(x, y) \ \forall (x, y) \in K \times \text{Fix}(T)$ ), where  $\text{Fix}(T) := \{x \in K : T(x) = x\}$ . Examples of  $D_{\Psi}$ -quasinonexpansive maps are given by left and right  $D_{\Psi}$ -resolvents and their special cases, left and right  $D_{\Psi}$ -proximal maps, which are generalisations of left and right  $D_{\Psi}$ -projections (see Table 1). In particular, left  $D_{\Psi}$ -resolvents satisfy the generalised pythagorean theorem (72). Under some conditions on  $\Psi$  (see Proposition 2.16.(i)–(ii)),  $D_{\Psi}$  allows to define a class of nonlinear maps  $T: K \to \operatorname{int}(\operatorname{efd}(\Psi)), \text{ with } \varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi)) \subseteq X, \text{ which satisfy}$ 

$$D_{\Psi}(x, T(y)) \le D_{\Psi}(x, y) \ \forall (x, y) \in \widehat{Fix}(T) \times K$$
(8)

(resp.,  $D_{\Psi}(T(x), y) \leq D_{\Psi}(x, y) \ \forall (x, y) \in K \times \widehat{Fix}(T)$ ), and are also closed under composition, where  $\widehat{F}$ ix(T) is a suitable topological generalisation of Fix(T) (see Definition 2.12). An additional necessary condition required for the composability of left (resp., right)  $D_{\Psi}$ -quasinonexpansive maps T is essentially a topological version of the left (resp., right) generalised pythagorean inequality, see Definition 2.13. The resulting monoids of left (resp., right) strongly  $D_{\Psi}$ -quasinonexpansive nonlinear maps are denoted as LSQ $(\Psi, K)$  (resp., RSQ $(\Psi, K)$ ). If  $\Psi$  satisfies the conditions allowing for the composable families of left (resp., right) strongly  $D_{\Psi}$ -quasinonexpansive maps, we will call it LSQ-composable (resp., RSQ-composable). Under some additional conditions on  $\Psi$  (see Proposition 2.16.(iii)–(iv)) making  $\Psi$  to be LSQ-adapted (resp., RSQ-adapted), left (resp., right)  $D_{\Psi}$ -projections and left (resp., right)  $D_{\Psi}$ -resolvents belong to LSQ( $\Psi, K$ ) (resp., RSQ( $\Psi, K$ )).

From an information theoretic perspective, if one interprets left and right  $D_{\Psi}$ -projections as implementing the process of statistical/information theoretic inference which satisfies the additive decomposition of a generalised pythagorean theorem, then the elements of monoids  $LSQ(\Psi, K)$  and  $RSQ(\Psi, K)$ can be seen as generalisations of such inferences, preserving (at least topologically) the constraint of additive decomposition with respect to  $D_{\Psi}$ .

<sup>&</sup>lt;sup>3</sup>More precisely, in the cases of right  $D_{\Psi}$ -projections and right  $D_{\Psi}$ -resolvents some additional conditions are required.

# 1.2 Categories, gauge $(\varphi)$ , and extension $(\ell)$

Our work has five interconnected layers: 1) new results for  $D_{\Psi}$  on reflexive Banach spaces  $(X, \|\cdot\|_X)$ ; 2) construction of suitable categories of left and right  $D_{\Psi}$ -projections as well as of  $LSQ(\Psi, K)$  and  $RSQ(\Psi, K)$  maps; 3) new results for  $D_{\Psi_{\varphi}}$  on reflexive Banach spaces  $(X, \|\cdot\|_X)$ ; 4) developing the theory of extended Vaĭnberg–Brègman functionals  $D_{\ell,\Psi}$  and quasinonexpansive maps over nonreflexive Banach spaces, together with the corresponding categories; 5) deriving a range of results for  $D_{\Psi}$  and  $D_{\ell,\Psi}$  in particular models, with a main focus on (nonreflexive) preduals of W\*- and JBW-algebras.

We contribute to the general theory of  $D_{\Psi}$  on reflexive Banach space  $(X, \|\cdot\|_X)$  with several new results, including an extension of a characterisation of right  $D_{\Psi}$ -projections to not necessarily finite  $\Psi$  (Proposition 3.1.(i)), providing the right version of Al'ber's generalised orthogonal decompositions (Proposition 3.9.(ii)), and providing sufficient conditions for: norm-to-norm continuity of right  $D_{\Psi}$ -projections (Proposition 3.3.(iii)–(iv)); continuity of right  $D_{\Psi}$ -proximal maps (Proposition 3.5.(ii)); Lipschitz-Hölder continuity of left and right  $D_{\Psi}$ -resolvents, left and right  $D_{\Psi}$ -proximal maps (Proposition 3.6), as well as left and right  $D_{\Psi}$ -projections (Corollary 3.7).

Under some restrictions, the sets of left and right  $D_{\Psi}$ -projections, as well as of LSQ( $\Psi, K$ ) and  $RSQ(\Psi, K)$  maps, can be turned into suitable categories (Definitions 3.39 and 3.43). Taking closed convex sets in  $(X, \|\cdot\|_X)$  as objects, left  $D_{\Psi}$ -projections onto such sets as morphisms, and defining the composition of morphisms as left  $D_{\Psi}$ -projections onto intersections of the respective sets, we obtain the category  $\mathtt{lCvx}(\Psi)$ . By restriction of objects to affine closed sets, we obtain the category  $\mathtt{lAff}(\Psi)$ . By taking objects given by  $\mathfrak{D}^{G}\Psi$ -convex  $\mathfrak{D}^{G}\Psi$ -closed sets in  $(X, \|\cdot\|_X)$  (i.e. sets such that their images in  $(X^*, \|\cdot\|_{X^*})$  under the map  $\mathfrak{D}^G\Psi: X \to X^*$  are convex and closed), morphisms given by their right  $D_{\Psi}$ -projections, and defining composition of morphisms as right  $D_{\Psi}$ -projections onto intersections of the respective sets, we obtain the category  $\bar{r}Cvx(\Psi)$ . Its restriction to  $\mathfrak{D}^G\Psi$ -affine  $\mathfrak{D}^G\Psi$ -closed sets is denoted  $\bar{r}Aff(\Psi)$ . These categories are well defined provided that we admit empty set as object and empty arrow,  $\lceil \varnothing \rceil$ , as morphism available between any two objects. The superscript  $\subseteq$  denotes restriction of the above categories to the case when the composition of morphisms is different from \[ \varnothing \] only if the codomain of the second projection is the subset of the codomain of the first projection. Assuming analogous conditions on the Fix(T) sets of left strongly  $D_{\Psi}$ -quasinonexpansive maps, and restricting them to be convex and closed, gives rise to the category  $LSQ_{cvx}^{\subseteq}$ . An analogous construction for right strongly  $D_{\Psi}$ -quasinonexpansive maps gives a category  $\bar{R}SQ_{cvx}^{\subseteq}$ . Hence, LSQ-composability (resp., RSQ-composability) of  $\Psi$  implies the possibility of defining the category  $LSQ_{cvx}^{\subseteq}$  (resp.,  $\bar{R}SQ_{cvx}^{\subseteq}$ ). If  $\Psi$  is LSQ-adapted (resp., RSQ-adapted), then there is an embedding functor from  $\mathtt{lCvx}^{\subseteq}(\Psi)$  to  $LSQ_{cvx}^{\subseteq}$  (resp., from  $\bar{r}Cvx^{\subseteq}(\Psi)$  to  $\bar{R}SQ_{cvx}^{\subseteq}$ ), as well as a functor right adjoint to it, which assigns to each T its fixed point set Fix(T) (Definition 3.44.(iii)–(vi) and Proposition 3.45.(ii)–(iii)). The categories  $\mathtt{ICvx}(\Psi)$  and  $\overline{\mathtt{r}}\mathtt{Cvx}(\Psi)$  are equivalent, and the same is true for  $\mathtt{LSQ}^{\subseteq}_{\mathtt{cvx}}(\Psi)$  and  $\overline{\mathtt{RSQ}}^{\subseteq}_{\mathtt{cvx}}(\Psi)$ , since the second element of each of these pairs is defined by means of the first one, through the Euler-Legendre transformation implemented by  $\mathfrak{D}^{G}\Psi$  (Propositions 3.41.(i) and 3.45.(i)).

For  $D_{\Psi}$  with  $\Psi = \Psi_{\varphi}$  and a gauge  $\varphi$ , we provide the first systematic study of the properties of this functional, obtaining an array of new results, including the sufficient conditions on linear norm-geometric properties of  $(X, \|\cdot\|_X)$  for: zone consistency and characterisation of left and right  $D_{\Psi_{i\sigma}}$ -projections by a generalised pythagorean inequality (Proposition 3.15); norm-to-norm continuity of left and right  $D_{\Psi_{\varphi}}$ -projections (Proposition 3.23) and of left and right  $D_{\Psi_{\varphi}}$ -resolvents (Proposition 3.27), continuity of left and right  $D_{\Psi_{\omega}}$ -proximal maps (Proposition 3.26), as well as uniform continuity and Lipschitz-Hölder continuity of left and right  $D_{\Psi_{\omega}}$ -projections (Proposition 3.29) and of left and right  $D_{\Psi_{\varphi}}$ -resolvents (Proposition 3.28); LSQ-composability, LSQ-adaptedness, RSQ-composability, and RSQ-adaptedness of  $\Psi_{\varphi}$  (Proposition 3.24). (See Table 2 for more detailed discussion of these notions and results.) Furthermore, we characterise the Euler-Legendre property of  $\Psi_{\varphi}$  by strict convexity and Gateaux differentiability of  $(X, \|\cdot\|_X)$  (Proposition 3.12). We also deliver several new results for  $\Psi = \Psi_{\varphi}$  with a quasigauge  $\varphi$ , which has been never considered before, including a characterisation of the Euler-Legendre property of  $\Psi_{\varphi}$  (Proposition 3.21) and sufficient conditions for a characterisation of left and right  $D_{\Psi_{\alpha}}$ -projections by the respective generalised pythagorean theorem (Proposition 3.22). Taken together, these results establish a strong bridge between norm and Vainberg-Brègman geometries of reflexive Banach spaces. They also play a key role in providing nontrivial operator algebraic

models of the extended Vaınberg-Brègman geometry in Section 4.

However, while the generalisation of (4) from  $D_1$  to  $D_{\Psi}$  has the same form as, and is completely analogous to, (5), the original result of Chencov is more subtle, and contains an additional layer of abstraction. In principle, the generalisation provided in [240, Prop. 4.11] deals with X given by the reflexive Banach space, with convexity and affinity specified in terms of the linear structure of X, and is applicable to  $D_1$  defined on  $\mathbb{R}^n$ . On the other hand, Chencov's result deals with  $D_1$  over  $(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ , which is nonreflexive Banach space, and it specifies affinity and convexity not in terms of the linear structure of  $L_1(\mathcal{X}, \mu)$  space, but in terms of exponential families, i.e. a nonlinear exponential coordinate map on this space. The same issue of a "suitable definition" of convexity and affinity of the sets for which a given family of relative entropies satisfies generalised pythagorean equation appears in [180, Prop. 8.1, Prop. 8.2], for a family  $D_{\gamma}$  of relative entropies over (nonreflexive) preduals of arbitrary W\*-algebras (see Corollary 4.3.(ii) and Remark 4.9.(i) for details).

In order to extend the applicability of the Vainberg-Brègman geometry beyond the class of reflexive Banach spaces  $(X, \|\cdot\|_X)$ , we consider the nonlinear bijective embedding  $\ell$  from the subset U of generally not reflexive Banach space  $(Y, \|\cdot\|_Y)$  into X. Each choice of  $\ell$  sets up a specific way of probing the structure of U (e.g., of a radially compact base norm space, such as a self-adjoint part of a predual of a W\*-algebra, or of some part of it, such as the unit ball, base, or a positive cone) in terms of the Vainberg-Brègman geometry of  $\ell(U)$  in X. In this sense,  $\ell$  establishes a global nonlinear coordinate system on U, modelled in X. Given  $\ell$ , we construct the extended Vainberg-Brègman functional  $D_{\ell,\Psi}(\phi,\psi) := D_{\Psi}(\ell(\phi),\ell(\psi))$  on U, with the convex analytic results proved for  $D_{\Psi}$  on  $(X,\|\cdot\|_X)$ pulled back into the corresponding results for  $D_{\ell,\Psi}$ . In consequence,  $D_{\ell,\Psi}$  provides an interface to the relationship between quantitative and geometric properties of the subset U of a Banach space  $(Y, \|\cdot\|_Y)$ , as perceived through the lenses of a nonlinear embedding ('coordinate system')  $\ell: U \to X$  and a convex function  $\Psi: X \to ]-\infty, \infty]$  ('loss/bias criterion of statistical discrimination'). As a part of this construction, the suitable properties of the subsets of  $(Y, \|\cdot\|_{Y})$  become expressed in terms of the corresponding properties of their  $\ell$ -embeddings into reflexive Banach space  $(X, \|\cdot\|_X)$ . Hence, we move from consideration of convexity (resp., affinity; closure;  $\mathfrak{D}^{G}\Psi$ -convexity;  $\mathfrak{D}^{G}\Psi$ -affinity;  $\mathfrak{D}^{G}\Psi$ -closure) of sets in  $(X, \|\cdot\|_X)$  to  $\ell$ -convexity (resp.,  $\ell$ -affinity;  $\ell$ -closure;  $(\mathfrak{D}^G \Psi \circ \ell)$ -convexity;  $(\mathfrak{D}^G \Psi \circ \ell)$ -affinity;  $(\mathfrak{D}^G \Psi \circ \ell)$ closure) of sets in  $(Y, \|\cdot\|_Y)$ . As a result, the extended Vaĭnberg-Brègman geometry features left  $D_{\ell,\Psi}$ projections onto  $\ell$ -convex  $\ell$ -closed sets, right  $D_{\ell,\Psi}$ -projections onto  $(\mathfrak{D}^{G}\Psi \circ \ell)$ -convex  $(\mathfrak{D}^{G}\Psi \circ \ell)$ -closed sets, monoids LSQ $(\ell, \Psi, C)$  and RSQ $(\ell, \Psi, C)$  of left and right strongly  $D_{\ell, \Psi}$ -quasinonexpansive maps, respectively, etc. (In particular, we obtain categories  $1\text{Cvx}(\ell, \Psi)$  and  $\bar{r}\text{Cvx}(\ell, \Psi)$  (as well as with their affine and  $\subseteq$ - subcategories),  $LSQ_{cvx}^\subseteq(\ell, \Psi)$  and  $\bar{R}SQ_{cvx}^\subseteq(\ell, \Psi)$ , and the corresponding functorial relationships between them.)

This way, by moving from  $D_{\Psi}$  to  $D_{\ell,\Psi} = D_{\Psi} \circ (\ell,\ell)$  we provide a partial reconcilliation between (arbitrary dimensional) Chencov's and Vaĭnberg–Brègman approaches by means of a setting, which we call the extended Vaĭnberg–Brègman geometry. While the results on uniqueness and existence of  $D_{\Psi}$ -projections can be pulled back without any additional topological assumptions on  $\ell$  (since bijectivity of  $\ell$  allows to use the topology induced by the norm topology of  $(X, \|\cdot\|_X)$ ), providing sufficient conditions for the stability of  $D_{\ell,\Psi}$ -projections, expressed in terms of their norm-to-norm continuity or uniform continuity, requires to impose the corresponding continuity conditions on  $\ell$ . As a result, the best behaved sector of the extended Vaĭnberg–Brègman geometry (which we identify as 'well adapted models') belongs to an intersection of the convex analysis on reflexive Banach spaces with the nonlinear homeomorphic theory of (arbitrary) Banach spaces.

#### 1.3 Models

We will call a pair  $(\ell, \Psi)$  an extended Vainberg-Brègman model of a generalised pythagorean geometry<sup>4</sup> iff it satisfies at least the following axioms:  $D_{\Psi}$  is an information (i.e.  $D_{\Psi}(x, y) = 0 \iff x = y$ ),

<sup>&</sup>lt;sup>4</sup>The terminological distinction between 'generalised pythagorean geometry' as a general concept and its models  $(\ell, \Psi)$ , based on reflexive spaces, reflects our belief that there should be a more general theory, unifying the general case of  $D_1$  (which satisfies its own versions of generalised pythagorean and generalised cosine theorems) with  $D_{\ell,\Psi}$  as developed here. In principle, the middle column in Table 2 provides an idea of a possible axiomatic system of such geometry, beyond the models  $(\ell, \Psi)$ . The ideas of [205, §3] were also aimed at such a theory. However, it remains unclear how to provide functional analytic implementation of such hypothetical Vaĭnberg–Brègman–Chencov unification (as opposed to

left and right  $D_{\Psi}$ -projections (onto, respectively, left and right  $D_{\Psi}$ -Chebyshëv subsets of  $(X, \|\cdot\|_X)$ ) exist, and they satisfy the corresponding generalised pythagorean inequalities. For  $\Psi = \Psi_{\varphi}$ , further strengthening of the model (allowing more axioms to be satisfied) is implemented by strengthening of the geometric properties of the corresponding norm  $\|\cdot\|_X$ , as shown in Table 2. While the definition of

		$ geometry of(X,   \cdot  _X)$
case	properties of the Vaĭnberg–Brègman geometry (satisfied in a given case)	$for \Psi = \Psi_{\varphi}$
	$D_{\Psi}$ and $D_{\Psi^{\text{F}}}$ are informations, left and right $D_{\Psi}$ -projections exist, and are	
I	characterised by the respective generalised pythagorean inequalities	$\mathbf{SC} \cap \mathbf{G} \cap \mathbf{R}$
II	left and right $D_{\Psi}$ -projections are norm-to-norm continuous $+$ all of above	$egin{array}{c} \uparrow \\ \mathbf{SC} \cap \mathbf{RRS} \cap \mathbf{F} \cap \mathbf{R} \\ \uparrow \end{array}$
$\mathrm{III^R/III^L}$	(norm-to-norm continuity of right $D_{\Psi}$ -resolvents + LSQ- and RSQ-compo-	$\mathbf{SC}  extstyle  extst$
,	sability/norm-to-norm continuity of left $D_{\Psi}$ -resolvents) + all of above	$/\mathbf{UC}\cap\mathbf{F}$
IV	RSQ-adaptedness + all of above	UC ∩ UF
$\rm V^L/\rm V^R$	left/right $D_{\Psi}$ -projections and left/right $D_{\Psi}$ -resolvents are uniformly continuous on bounded subsets $+$ all of above	$ \begin{array}{c} \uparrow \\ \frac{1}{\beta}\text{-}\mathbf{UC}\cap\mathbf{UF}/\\ /\mathbf{UC}\cap\frac{1}{\beta}\text{-}\mathbf{UF} \end{array} $
VI	left and right $D_{\Psi}$ -projections and $D_{\Psi}$ -resolvents are Lipschitz–Hölder continuous $+$ all of above	$ \uparrow \\ \frac{1}{\beta} \text{-}\mathbf{UC} \cap \frac{1}{\gamma} \text{-}\mathbf{UF} $
$\mathrm{II_{p}}$	LSQ-adaptedness + all of case I	$\mathbf{SC} \cap \mathbf{UF}$

Table 2: Different cases of Vaĭnberg–Brègman geometric axioms, and the corresponding conditions on the Banach geometry of  $(X, \|\cdot\|_X)$  which are sufficient for these axioms to hold for  $\Psi = \Psi_{\varphi}$  with a gauge  $\varphi$ . Notation:  $\mathbf{SC}$  = strict convexity,  $\mathbf{G}$  = Gateaux differentiability,  $\mathbf{R}$  = reflexivity,  $\mathbf{RRS}$  = the Radon–Riesz–Shmul'yan property,  $\mathbf{F}$  = Fréchet differentiability,  $(\frac{1}{\beta})\mathbf{UF} = (\frac{1}{\beta})$ -uniform Fréchet differentiability,  $(\frac{1}{\beta})\mathbf{UC} = (\frac{1}{\beta})$ -uniform convexity. These results are obtained in Propositions 3.15, 3.23, 3.24, 3.27, 3.28, and 3.29. While for any model  $(\ell, \Psi)$  we require left and right  $D_{\Psi}$ -projections to satisfy the respective generalised pythagorean inequalities, case I strengthens this to a requirement of characterisation. Case III<sup>b</sup> is included in case III<sup>R</sup>, but not in case III<sup>L</sup>.

a model of generalised pythagorean geometry does not impose any additional conditions on a bijection  $\ell: U \to \ell(U) \subseteq X$ , this is not longer so for its further refinements. Borrowing a terminology from [129, p. 231]<sup>5</sup>, we will call a model  $(\ell, \Psi)$ , not necessarily with  $\Psi = \Psi_{\varphi}$ , to be well adapted (resp., very well adapted) iff it satisfies all axioms of case IV (resp., case V) and  $\ell$  is norm-to-norm continuous (resp., a uniform homeomorphism). For  $(\ell, \Psi = \Psi_{\varphi})$  with a gauge  $\varphi$  it turns out that the properties of case I–IV models do not depend on the choice of  $\varphi$ , but (essentially due to Proposition 2.25.(vii)–(viii)) such dependence appears for case V<sup>L</sup>/V<sup>R</sup> (so, also for case VI) models. Hence, a passage from norm-to-norm continuity of left and right  $D_{\Psi_{\varphi}}$ -projections to their uniform continuity includes becoming

a more modest approach offered here).

<sup>&</sup>lt;sup>5</sup>There is a range of structural analogies that justify such terminological adaptation, arising from a distinction between an "axiomatic level" (which, in convex theoretic case, deals with two vector spaces in algebraic duality, without assuming a priori topological or differentiability properties on  $\Psi$  [205, §3.2]), and its specific implementation, involving various possible topological or bornological models. In particular, on the axiomatic side, existence of a global singleton selection  $\mathfrak{D}^{\partial}\Psi$  of a subdifferential  $\partial\Psi$  can be seen as an analogue of existence of a nonzero object of nilpotent infinitesimals, existence of nonempty  $D_{\Psi}$ -Chebyshëv sets (using  $\mathfrak{D}^{\partial}\Psi$  as replacement of  $\mathfrak{D}^{G}\Psi$  in the definition of  $D_{\Psi}$ ) can be viewed as an analogue of the Kock-Lawvere axiom, while case V<sup>L</sup>/V<sup>R</sup> axioms can be viewed as an analogue of an axiom set including locality and archimedean structure of a ring of real numbers. On the model side, given a semifinite W\*-algebra  $\mathcal{N}$  with a faithful normal semifinite trace  $\tau$ , the embedding  $\ell: \mathcal{N}_{\star} \to E(\mathcal{N}, \tau)$ , with  $\mathcal{N}_{\star} \cap \mathcal{N} \sqsubseteq E(\mathcal{N}, \tau) \sqsubseteq \mathcal{N}_{\star} + \mathcal{N}$ and  $E(\mathcal{N}, \tau)$  given by a reflexive rearrangement invariant Banach space over  $\mathcal{N}$ , can be seen as as somewhat analogous to the Yoneda embedding  $Y: \mathtt{C} \hookrightarrow \mathtt{Set}^{\mathtt{C}^{\mathrm{op}}}$ . In both cases the main role of embedding is to enrich the original space (C or  $\mathcal{N}_{\star}$ ) with the additional geometric structure, sufficient to model the axiomatic system. Furthermore, bijectivity of  $\ell$  corresponds to full and faithful Y; restriction of  $\ell$  to norm-to-norm homeomorphisms corresponds to restriction from  $Set^{C^{op}}$  to Sh(C, J) with respect to Grothendieck topology J on C; restriction of  $\ell$  to uniform homeomorphisms corresponds to restriction of J to Grothendieck subcanonical topologies. See [254] for a detailed discussion of the notion of well adapted model in topos-theoretic context. Cf. also Remark 2.1.(iii) for further references regarding  $\mathfrak{D}^{\partial}\Psi$  and models of  $D_{\Psi}$  constructed with it.

sensitive to the properties of a particular  $\varphi$ . Furthermore, since uniform homeomorphy of unit balls of two Banach spaces does not imply uniform homeomorphy of these spaces, a passage to very well adapted models amounts, in practice (and for  $\Psi = \Psi_{\varphi}$ ), to restriction of considerations to the extended Vaĭnberg–Brègman geometry of a unit ball (and its subsets). Examples of this situation are provided in Propositions 4.4, Corollary 4.8, and Proposition 4.10.(vii)–(viii). Under generalisation from gauges to quasigauges, there is already a split of case I models into left and right cases ( $I^L/I^R$ ), dependently on the particular properties of a quasigauge (Proposition 3.22).

The examples of well adapted case IV models are given by  $(\ell_{\gamma}, \Psi_{\varphi})$ , with the Mazur map  $\ell_{\gamma}(\phi) := \phi^{\gamma}$ , for  $\gamma \in ]0,1[$ , mapping preduals of arbitrary W\*-algebras and semifinite JBW-algebras into the corresponding  $L_{1/\gamma}$  spaces over these algebras (Proposition 4.1 and 4.7). The resulting extended Vaĭnberg–Brègman geometries over the respective preduals of W\*- and JBW-algebras depend only on the choice of  $\gamma$  and gauge  $\varphi$ . Case V<sup>L</sup> (resp., V<sup>R</sup>) models are given by  $(\ell_{\gamma}, \Psi_{\varphi})$  with  $L_{1/\gamma}$  spaces over arbitrary W\*-algebras and semifinite JBW-algebras for  $\varphi(t) = \varphi_{1,\beta}(t) := t^{1/\beta-1}$  with  $\beta \in \{\frac{1}{2}, 1-\gamma\}$  if  $\gamma \in [\frac{1}{2}, 1[$  and with  $\beta = \gamma$  if  $\gamma \in ]0, \frac{1}{2}[$  (resp., with  $\beta \in \{\frac{1}{2}, 1-\gamma\}$  if  $\gamma \in ]0, \frac{1}{2}[$  and with  $\beta = \gamma$  if  $\gamma \in [\frac{1}{2}, 1[$ ) (Proposition 4.4 and Corollary 4.8). Hence, as opposed to the case I–IV models, for which the choice of the particular  $\varphi$  does not make any difference regarding presence or absence of the given geometric properties under consideration, case V<sup>L</sup> and case V<sup>R</sup> models are specified only for the particular family of  $\varphi$ , and their properties depend on the choice of a subfamily. Among the case V<sup>L</sup> and case V<sup>R</sup> models we specify a class of very well adapted models, by restriction of  $\ell_{\gamma}$  to a unit ball of the respective predual. For these models we calculate the modulus of continuity (more specifically, the value of t for t-Lipschitz–Hölder continuity) of left and right  $D_{\ell_{\gamma},\Psi_{\varphi_1}}$ -projections.

the value of t for t-Lipschitz-Hölder continuity) of left and right  $D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}$ -projections. From the perspective of differential and convex geometric properties of the Banach space norm, the structure of  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  spaces does not exhibit major variability in the range of  $\gamma \in ]0,1[\setminus \{\frac{1}{2}\}]$ . In consequence, some differences in the resulting generalised pythagorean geometries show up only at the level of case  $V^L/V^R$  and case VI models, through dependence of the uniform and Lipschitz-Hölder continuity on the available values (p,q) of p-uniform convexity and q-uniform Fréchet differentiability. In the context of the analysis of the extended Vaınberg-Brègman geometries induced over preduals of semifinite  $W^*$ -algebras  $\mathcal{N}$  from the norm geometry of noncommutative Orlicz spaces  $(L_{\Upsilon}(\mathcal{N},\tau), \|\cdot\|_{\Upsilon,p})$  spaces [207], two main virtues of having independent analysis for  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  spaces are: to have the range of results available for type III  $W^*$ -algebras, and to have a range of results allowing for a direct generalisation to semifinite JBW-algebras.

We give also two examples of models with  $\Psi = \Psi_{\varphi}$ , but with  $\ell$  different from the Mazur (as well as Kaczmarz) map, given by the (inverse of) Lozanovskii map  $\ell_X$ . Proposition 4.10 provides well adapted (resp., very well adapted) case  $V^L$  and  $V^R$  models with  $\ell$  given by an inverse of the Lozanovskii factorisation map  $\ell_X^{-1}$ , with  $(X, \|\cdot\|_X)$  given by a uniformly convex and uniformly Fréchet differentiable (resp., p-uniformly convex and q-uniformly Fréchet differentiable) Banach function space over a localisable measure space  $(\mathcal{X}, \mu)$ , and the domain of  $\ell_X$  given by  $S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ . Proposition 4.11 provides an analogue of this result for  $(X, \|\cdot\|_X)$  given by a uniformly convex and uniformly Fréchet differentiable (resp., p-uniformly convex and q-uniformly Fréchet differentiable) noncommutative rearrangement invariant Banach space over type  $I_n$  W\*-algebra (i.e.  $n \in \mathbb{N}$ , and  $(X, \|\cdot\|_X)$  is a space  $M_n(\mathbb{C})$ of  $n \times n$  matrices with complex entries, equipped with a unitary invariant matrix norm). Proposition 4.13 provides case I model for preduals of generalised spin factors, with  $\ell$  mapping from a base of a base normed space into a unit ball of a reflexive Banach space. This result goes beyond the realms of W\*- and JBW-algebras, and provides an example of application of our framework to the general base normed spaces (in particular, Proposition 4.13 characterises the presence of Alfsen–Shultz spectral duality between base normed space and its Banach dual by the condition that  $\Psi_{\varphi}$  is Euler–Legendre, which is equivalent to Gateaux differentiability and strict convexity of  $(X, \|\cdot\|_X)$ .

Finally, we specify also some examples of case I models featuring  $\Psi \neq \Psi_{\varphi}$ . Proposition 4.15 uses  $\ell = \ell_{1/2}$  (with a codomain  $\mathcal{H}$  denoting either a nonassociative  $L_2$  space or a self-adjoint part of a noncommutative  $L_2$  space) with  $\Psi(x) := \frac{1}{2} \langle Tx, x \rangle_{\mathcal{H}}$ , where T is a continuous linear map satisfying  $\exists \lambda > 0 \ \forall x, y \in \mathcal{H} \ \langle Tx - Ty, y - x \rangle_{\mathcal{H}} \geq \lambda \|x - y\|_{\mathcal{H}}^2$ . Proposition 4.16 uses  $\Psi$  given by a spectral convex Euler-Legendre function on the space of finite dimensional self-adjoint matrices (with two new particular examples of such functions given in Corollary 4.17.(iv)-(v)). Proposition 4.20 provides an

extension of this approach to Schatten classes  $(\mathfrak{G}(\mathcal{H}))^{\mathrm{sa}}$  of self-adjoint compact operators on a separable Hilbert space  $\mathcal{H}$  (with  $((\mathfrak{G}(\mathcal{H}))^{\mathrm{sa}}, \|\cdot\|_{(\mathfrak{G}(\mathcal{H}))^{\mathrm{sa}}})$  uniformly convex and uniformly Fréchet differentiable and  $\ell$  given by the Lozanovskiĭ map  $\ell_{(\mathfrak{G}(\mathcal{H}))^{\mathrm{sa}}})$ , resulting in models  $(\ell, \Psi)$  on  $\mathcal{N}_{\star}^{\mathrm{sa}} = ((\mathfrak{B}(\mathcal{H}))^{\mathrm{sa}})_{\star}$  such that  $\Psi$  is Euler–Legendre, while it is not assumed to be  $\Psi_{\varphi}$ . (However, while this construction is a natural extension of already established results, we are currently missing concrete examples of  $\Psi \neq \Psi_{\varphi}$  at this level of generality.)

## 1.4 Plan of the paper

Section 2 covers background definitions and properties used in the rest of this paper. Section 2.1 introduces key notions from convex analysis on Banach spaces. Section 2.2 presents the properties of left and right Vaĭnberg–Brègman projections and quasinonexpansive maps, which will be used extensively in Section 3. Section 2.3 discusses the properties of Banach norm geometry as characterised by  $\Psi_{\varphi}$ , which will be used in Section 3.2.

Section 3 contains new results in the Vaĭnberg–Brègman theory on reflexive Banach spaces, as well as it develops the theory of extended Vaĭnberg–Brègman geometries on arbitrary Banach spaces. In Section 3.1 we establish results applicable to arbitrary Vaĭnberg–Brègman functionals on reflexive Banach spaces. Section 3.2 is concerned with the special case, when  $\Psi$  is given by an integral of a gauge (or quasigauge) function  $\varphi$ , i.e.  $\Psi = \Psi_{\varphi}$ . Section 3.3 encapsulates the results of Sections 3.1 and 3.2 into the general setting of extended Vaĭberg–Brègman geometry, based on composition of  $D_{\Psi}$  on reflexive Banach space  $(X, \|\cdot\|_X)$  with a nonlinear homeomorphism  $\ell$  from a subset of an arbitrary Banach space  $(Y, \|\cdot\|_Y)$ . Section 3.4 provides construction of suitable categories of left and right  $D_{\ell,\Psi}$ -projections, as well as categories of left and right strongly  $D_{\ell,\Psi}$ -quasinonexpansive maps, together with some elementary results about functors between them.

Section 4 applies the results of Section 3 to the case when  $(Y, \|\cdot\|_Y)$  is (in principle) a base normed space, and  $(X, \|\cdot\|_X)$  is a suitable reflexive space constructed over  $(Y, \|\cdot\|_Y)$ . Nearly all of results in Section 4 are obtained in a modest setting, when  $(Y, \|\cdot\|_Y)$  is a predual of an arbitrary W\*-algebra or of a semifinite JBW-algebra and  $(Y, \|\cdot\|_Y)$  is, respectively, nonassociative or noncommutative rearrangement invariant space over this algebra. In particular, in Section 4.1 we consider  $\Psi = \Psi_{\varphi}$  with  $(X, \|\cdot\|_X)$ given by noncommutative and nonassociative  $(L_{1/\gamma}, \|\cdot\|_{1/\gamma})$  spaces for  $\gamma \in ]0, 1[$ , and  $\ell$  given by the corresponding Mazur maps  $\ell_{\gamma}$ . To show the flexibility of the framework (and its applicability for the general statistical theory on base normed spaces), in Section 4.2 we provide an example beyond JBW-algebraic setting, with  $(Y, \|\cdot\|_Y)$  given by preduals of generalised spin factors [50]. Apart from this, Section 4.2 contains also an example of  $\ell$  given by the Lozanovskiĭ uniform homeomorphism  $\ell_X$ , which goes far beyond the realms of Mazur (resp., Kaczmarz) maps into  $L_{1/\gamma}$  (resp., Orlicz) spaces, and is applicable to embedding of  $S(L_1(\mathcal{X},\mu),\|\cdot\|_1)$  into any uniformly convex and uniformly Fréchet differentiable function space over a localisable measure space  $(\mathcal{X}, \mu)$ . We also provide an analogue of that result for preduals of type  $I_n$  W\*-algebras  $\mathcal{N}$  (i.e.  $\mathcal{N} = \mathfrak{B}(\mathcal{H})$  for dim  $\mathcal{H} =: n \in \mathbb{N}$ ). While the results of Sections 4.1–4.2 rely on an assumption  $\Psi = \Psi_{\varphi}$ , in Section 4.3 we provide few examples of models with  $\Psi \neq \Psi_{\varphi}$ .

There is essentially no new results in Section 2,<sup>6</sup> yet we provide some new definitions, including the notions of left/right pythagorean  $D_{\Psi}$  and LSQ/RSQ( $\Psi$ )-adapted/composable maps (which package formerly known properties into suitable objects). Contrary to that, all definitions and propositions/corollaries in Sections 3 and 4 are new, either completely or in their (extended) range of generality (with the exception of Propositions 3.5.(i), 3.9.(i)+(iii), 3.29.(i), 4.10.(i), 4.11.(i), 4.12.(iv), 4.15.(i)-(iv), and equivalence of 1) and 2) in Proposition 4.13). The detailed discussion of relationships with the formerly known results is provided in the remarks at the end of each subsection.

#### 2 Background definitions and properties

In what follows,  $(X, \|\cdot\|_X)$  will denote a Banach space over  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$  [37, §1],  $B(X, \|\cdot\|_X) := \{x \in X : \|x\|_X \le 1\}$ ,  $S(X, \|\cdot\|_X) := \{x \in X : \|x\|_X = 1\}$ . If  $\lambda \in \mathbb{R}$  and  $Z \subseteq X$ , then  $\lambda Z := \bigcup_{x \in Z} \{\lambda x\}$ .

<sup>&</sup>lt;sup>6</sup>With a possible minor exception of Corollary 2.26, which is straightforward, but we have not found it in the literature.

 $(X^\star,\|\cdot\|_{X^\star})$  will denote a Banach space of continuous linear functions  $X\to\mathbb{K}$ , equipped with a norm  $\|y\|_{X^\star}:=\sup\{|y(x)|:\|x\|_X\leq 1\}\ \forall y\in X^\star\ [161,\ \mathrm{p.}\ 62],\ \mathrm{and}\ \mathrm{will}\ \mathrm{be}\ \mathrm{called}\ \mathrm{a}\ Banach\ dual\ \mathrm{of}\ (X,\|\cdot\|_X)$  (with respect to a bilinear duality  $[\![x,y]\!]_{X\times X^\star}:=y(x)\in\mathbb{K}\ \forall x\in X\ \forall y\in X^\star$ ).  $(X,\|\cdot\|_X)$  is called  $reflexive\ [154,\ \mathrm{pp.}\ 219-220]$  iff  $J_X:X\ni x\mapsto [\![x,\cdot]\!]_{X\times X^\star}\in X^{\star\star}$  is an isometric isomorphism. By default, unless stated otherwise, all references to continuity and closure/openness of sets will be understood in the sense of the norm topology of an underlying Banach space. In particular, given  $(X,\|\cdot\|_X)$ , for any  $Y\subseteq X$ ,  $\mathrm{int}(Y)$  (resp.,  $\mathrm{cl}(Y)$ ) will denote a topological interior (resp., closure) of Y with respect to the topology of  $\|\cdot\|_X$ . If  $(X,\|\cdot\|_X)$  and  $(Y,\|\cdot\|_Y)$  are Banach spaces, then  $(X,\|\cdot\|_X)\subseteq (Y,\|\cdot\|_Y)$  will denote a continuous embedding  $X\subseteq Y$ . (In more general situation, the reference to a particular norm will be provided in a subscript of cl and int.) Given Banach spaces  $(X,\|\cdot\|_X)$  and  $(Y,\|\cdot\|_Y)$ ,  $Z\subseteq X$ ,  $W\subseteq Y$ , a function  $f:Z\to W$  is said to be:  $uniformly\ continuous\ \mathrm{on}\ Z$  iff

$$\forall \epsilon_1 > 0 \ \exists \epsilon_2 > 0 \ \forall x, y \in Z \ \|x - y\|_X < \epsilon_2 \ \Rightarrow \ \|f(x) - f(y)\|_Y < \epsilon_1; \tag{9}$$

t-Lipschitz-Hölder continuous<sup>7</sup> on Z for  $t \in ]0, \infty[$  (called an exponent of f) iff

$$\exists c > 0 \ \forall x, y \in Z \ \|f(x) - f(y)\|_{Y} \le c\|x - y\|_{X}^{t}; \tag{10}$$

**Lipschitz continuous** on Z iff it satisfies (10) with t=1. If  $t\in ]0,1]$  and f is t-Lipschitz-Hölder continuous on Z, then it is uniformly continuous on Z and r-Lipschitz-Hölder continuous on Z  $\forall r\in ]0,t[$ . For any Banach spaces  $(X,\|\cdot\|_X)$  and  $(Y,\|\cdot\|_Y)$ , any uniform homeomorphism  $\alpha:S(Y,\|\cdot\|_Y)\to S(X,\|\cdot\|_X)$  extends to a uniform homeomorphism [266, Prop. 2.9]

$$B(Y, \|\cdot\|_Y) \ni x \mapsto \begin{cases} \|x\|_Y \alpha \left(\frac{x}{\|x\|_Y}\right) \in B(X, \|\cdot\|_X) & : x \in B(Y, \|\cdot\|_Y) \setminus \{0\} \\ 0 & : x = 0. \end{cases}$$

$$(11)$$

Conversely [49, p. 197], for any uniform homeomorphism  $\alpha: B(Y, \|\cdot\|_Y) \to B(X, \|\cdot\|_X)$  there exists a corresponding uniform homeomorphism

$$S(Y, \|\cdot\|_Y) \ni x \mapsto \frac{\alpha(x)}{\|\alpha(x)\|_X} \in S(X, \|\cdot\|_X). \tag{12}$$

If  $\alpha: S(Y, \|\cdot\|_Y) \to S(X, \|\cdot\|_X)$  (resp.,  $\alpha: B(Y, \|\cdot\|_Y) \to B(X, \|\cdot\|_X)$ ) is t-Lipschitz–Hölder continuous, then the map (11) (resp., (12)) is t-Lipschitz–Hölder continuous [3, Lemm. 3.1].

 $\Psi: X \to ]-\infty, \infty]$  will be called: **proper** iff  $\operatorname{efd}(\Psi) := \{x \in X : \Psi(x) \neq \infty\} \neq \emptyset$ ; **coercive** iff  $\lim_{\|x\|_X \to \infty} \Psi(x) = \infty$ ; **supercoercive** iff  $\lim_{\|x\|_X \to \infty} \frac{\Psi(x)}{\|x\|_X} = \infty$ ; **lower semicontinuous** iff  $\{x \in X : \Psi(x) \leq \lambda\}$  is closed  $\forall \lambda \in \mathbb{R}$  iff  $f(x) \leq \liminf_{y \to x} f(y)$ ; **convex** iff

$$x \neq y \Rightarrow \Psi(\lambda x + (1 - \lambda)y) \le \lambda \Psi(x) + (1 - \lambda)\Psi(y) \ \forall x, y \in \text{efd}(\Psi) \ \forall \lambda \in ]0,1[$$
 (13)

(this is equivalent to the definition based on the same inequality, with quantifiers changed to  $\forall x,y \in X \ \forall \lambda \in [0,1]$ , with the conventions  $\infty + \infty \equiv \infty$ ,  $0 \cdot \infty \equiv \infty$ , and without  $x \neq y$  assumption); **strictly convex** iff (13) holds under the same quantifiers and with  $\leq$  replaced by <. The set of all proper, convex, lower semicontinuous functions  $\Psi : X \to ]-\infty,\infty]$  will be denoted by  $\Gamma(X,\|\cdot\|_X)$ . If  $\Psi \in \Gamma(X,\|\cdot\|_X)$ , then  $\Psi$  is continuous on  $\inf(\operatorname{efd}(\Psi))$  [298, Cor. 7C]. For any  $K \subseteq X$ , an **indicator** function of K on X is given by  $\iota_K(x) := \left\{ \begin{array}{ccc} 0 & : x \in K \\ \infty & : x \notin K \end{array} \ \forall x \in X.$  If K is nonempty, convex, and closed, then  $\iota_K \in \Gamma(X,\|\cdot\|_X)$  [256, p. 2897] [297, p. 23].

For convenience of notation, from now on, and until the end of Section 2 (as well as in entire Section 3), we will assume that  $\mathbb{K} = \mathbb{R}$  (all results and formulas of those Sections are applicable for the case  $\mathbb{K} = \mathbb{C}$  under replacement of  $[\![\cdot,\cdot]\!]_{X\times X^*}$  by re  $[\![\cdot,\cdot]\!]_{X\times X^*}$ ). Convention inf  $\emptyset=\infty$  will be applied everywhere. For any set Z,  $Z^Z$  will denote the set of all subsets of Z.

<sup>&</sup>lt;sup>7</sup>This condition, both for t = 1 and t < 1 has been introduced first by Lipschitz, respectively, in [228, Eqn. (2)] and [228, Eqn. (2\*)], published 6 years before Hölder's [165, pp. 17–18].

#### 2.1 Convex analytic preliminaries

#### 2.1.1 Differentiability and Mandelbrojt-Fenchel duality

For any  $T: X \to 2^{X^*}$ ,  $\operatorname{efd}(T) := \{x \in X : T(x) \neq \emptyset\}$ . The **subdifferential** of a proper  $\Psi: X \to ]-\infty,\infty[$  is [297, Def. 2-G] [259, Eqn. (1)] [253, Def. 4]

$$\partial \Psi(x) := \{ y \in X^* : \Psi(z) - \Psi(x) \ge [\![z - x, y]\!]_{X \times X^*} \ \forall z \in X \} \ \forall x \in X.$$
 (14)

Hence,  $\partial \Psi(x) = \emptyset \ \forall x \in X \setminus \operatorname{efd}(\Psi) \ \operatorname{and} \ \operatorname{efd}(\partial \Psi) = \{x \in \operatorname{efd}(\Psi) : \partial \Psi(x) \neq \emptyset\}$ . If  $\Psi: X \to ]-\infty, \infty]$  is proper, then the **right Gateaux derivative** of  $\Psi$  at  $x \in \operatorname{efd}(\Psi)$  in the direction  $h \in X$  reads [25, p. 53]

$$\operatorname{efd}(\Psi) \times X \ni (x,h) \mapsto \mathfrak{D}_{+}^{G} \Psi(x,h) := \lim_{t \to +0} (\Psi(x+th) - \Psi(x))/t \in ]-\infty, \infty], \tag{15}$$

and it exists  $\forall h \in X$ . If  $\Psi \in \Gamma(X, \|\cdot\|_X)$ , then  $\mathfrak{D}_+^G \Psi(x, \cdot)$  is Lipschitz continuous and finite  $\forall x \in \operatorname{int}(\operatorname{efd}(\Psi))$  (cf., e.g., [84, Cor. 1.1.6]).  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is called  $\operatorname{Gateaux}$  differentiable at  $x \in \operatorname{int}(\operatorname{efd}(\Psi))$  [148, p. 311] iff  $\mathfrak{D}_+^G \Psi(x,y) = -\mathfrak{D}_+^G \Psi(x,-y)$   $\forall y \in X$ . In such case  $\mathfrak{D}_+^G \Psi(x,\cdot)$  is linear, so it defines a bounded linear operator  $\mathfrak{D}_+^G \Psi(x,y) =: \left[ \left[ y, \mathfrak{D}^G \Psi(x) \right] \right]_{X \times X^*} \forall y \in X$  [328, Def. 3]. (If  $x \in X = \mathbb{R}^n$ , then  $\mathfrak{D}^G \Psi(x) = \operatorname{grad}\Psi(x) := \left( \frac{\partial}{\partial x^1}, \dots, \frac{\partial}{\partial x^n} \right) \Psi(x)$ .) A set of all  $\Psi \in \Gamma(X, \|\cdot\|_X)$  that are Gateaux differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi)) \neq \varnothing$  will be denoted  $\Gamma^G(X, \|\cdot\|_X)$ . If  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is Gateaux differentiable at  $x \in \operatorname{int}(\operatorname{efd}(\Psi))$ , then  $\partial \Psi(x) = \{\mathfrak{D}^G \Psi(x)\}$  [258, p. 20]. Combined with (14), this gives

$$\Psi(x) - \Psi(y) - \left[ \left[ x - y, \mathfrak{D}^{G} \Psi(y) \right] \right]_{X \times X^{\star}} \ge 0 \ \forall (x, y) \in X \times \operatorname{int}(\operatorname{efd}(\Psi)).$$
 (16)

 $\Psi \in \Gamma(X, \|\cdot\|_X)$  will be called: **Fréchet differentiable** at  $x \in \text{int}(\text{efd}(\Psi))$  iff [145, p. 808] [143, p. 309] it is Gateaux differentiable at x and  $\mathfrak{D}^G\Psi(x)$  is uniformly continuous on  $S(X, \|\cdot\|_X)$ ; **uniformly Gateaux differentiable** on  $\varnothing \neq K \subseteq \text{efd}(\Psi)$  [312, p. 4] (=[313, p. 643]) [34, Def. 1] [361, p. 207] iff there exists  $g: [0, \infty[ \to [0, \infty] \text{ with } g(0) = 0 \text{ and } \lim_{t \to +0} \frac{g(t)}{t} = 0 \text{ such that}$ 

$$\forall x \in K \ \forall y \in X \ \forall \lambda \in ]0,1[\ \Psi(x) + \lambda(1-\lambda)g(\|y\|_X) \ge (1-\lambda)\Psi(x-\lambda y) + \lambda(x+(1-\lambda)y); \tag{17}$$

essentially Gateaux differentiable [40, Def. 5.2.(i), Thm. 5.6] iff  $\operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$  and  $\partial \Psi(x) = \{*\}$   $\forall x \in \operatorname{efd}(\partial \Psi)$ ; essentially strictly convex [40, Def. 5.2.(ii)] iff  $\Psi$  is strictly convex on every convex subset of  $\operatorname{efd}(\partial \Psi)$  and

$$\exists \varepsilon > 0 \ \forall x \in \operatorname{efd}((\partial \Psi)^{-\mathsf{I}}) \ \sup\{ \left\| (\partial \Psi)^{-\mathsf{I}}(x + \varepsilon y) \right\|_{X} : y \in X, \ \|y\|_{X} \le 1 \} < \infty, \tag{18}$$

where  $(\partial \Psi)^{-1}(y) := \{x \in X : y \in \partial \Psi(x)\}$ ; Euler-Legendre [40, Def. 5.2.(iii)] iff it is essentially Gateaux differentiable and essentially strictly convex. If  $\Psi \in \Gamma(X, \|\cdot\|_X)$  and  $\operatorname{efd}(\Psi) = X$ , then  $\Psi$  will be called: uniformly Fréchet differentiable on X (resp., on  $\varnothing \neq K \subseteq X$ ) [312, p. 4] (=[313, p. 643]) [361, Thm. 3.5.6] iff  $\Psi$  is Fréchet differentiable at any  $x \in X$  (resp.,  $x \in K$ ), and  $\mathfrak{D}^G \Psi$  is uniformly continuous on X (resp.,  $\mathfrak{D}^G \Psi(x)(h)$  exists in uniform convergence  $\forall (x,h) \in K \times S(X,\|\cdot\|_X)$ ); uniformly Fréchet differentiable on bounded subsets of X [361, p. 221] iff  $\Psi$  is uniformly Fréchet differentiable on  $\lambda B(X,\|\cdot\|_X)$   $\forall \lambda > 0$ . If  $\Psi \in \Gamma(X,\|\cdot\|_X)$  and  $\operatorname{efd}(\Psi) \neq \{*\}$ , then  $\Psi$  is called uniformly convex at  $x \in \operatorname{efd}(\Psi)$  (resp., on X; on bounded subsets of X) [26, p. 231] [359, Def. 2.1] (resp., [219, p. 997] [335, Def. 1]; [361, p. 221])<sup>8</sup> iff

$$\forall t \in ]0, \infty[ \inf \left\{ \frac{1}{2} \Psi(x) + \frac{1}{2} \Psi(y) - \Psi\left(\frac{x+y}{2}\right) : y \in \text{efd}(\Psi), \|y-x\|_X = t \right\} > 0$$
 (19)

(resp., with  $x \in \text{efd}(\Psi)$  replaced by:  $y, x \in \text{efd}(\Psi)$ ;  $y \in \text{efd}(\Psi)$ ,  $x \in \lambda B(X, \|\cdot\|_X)$  (together with  $\forall \lambda > 0$  condition stated outside of  $\inf\{\ldots\}$ )).

If  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is Fréchet differentiable at  $x \in \operatorname{int}(\operatorname{efd}(\Psi))$ , then  $\mathfrak{D}^{\mathrm{G}}\Psi(x)$  will be denoted by  $\mathfrak{D}^{\mathrm{F}}\Psi(x)$ . If  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is essentially Gateaux differentiable, then  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$  [40, Thm. 5.6.(iv), 5.6.(v)]. If  $\emptyset \neq C \subseteq X$  is open and convex, and  $\Psi : C \to \mathbb{R}$  is convex, continuous, and Gateaux

<sup>&</sup>lt;sup>8</sup>For equivalence of different formulas used in these definitions, see [359, Rem. 2.1] and [85, Lemm. 2.2].

differentiable on C, then ( $\Psi$  is Fréchet differentiable on C iff  $\mathfrak{D}^{G}\Psi$  is norm-to-norm continuous) [275, Prop. 2.8].

For a proper  $\Psi: X \to ]-\infty, \infty]$ ,

$$X^* \ni y \mapsto \Psi^{\mathbf{F}}(y) := \sup_{x \in X} \{ [x, y]_{X \times X^*} - \Psi(x) \} \in ] - \infty, \infty],$$
 (20)

which will be called the Mandelbrojt-Fenchel dual of  $\Psi$  [239, Eqn. (1)] [140, p. 75] [257, p. 8], satisfies  $\Psi^{\mathbf{F}} \in \Gamma(X^*, \|\cdot\|_{X^*})$  [166, Thm. 5] [257, p. 9] (cf. also [70, Thm. 3.6]). If  $\Psi \in \Gamma(X, \|\cdot\|_X)$ , then  $(\Psi^{\mathbf{F}})^{\mathbf{F}}|_{J_X(X)} = \Psi$  [140, Thm. (p. 75)] [70, Thm. 3.13]. Furthermore, by (20), Fenchel inequality holds [140, p. 75] [70, p. 13]:

$$\Psi(x) + \Psi^{\mathbf{F}}(y) - [x, y]_{X \times X^*} \ge 0 \ \forall (x, y) \in X \times X^*, \tag{21}$$

with = attained iff  $y \in \partial \Psi(x)$ . If  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$  then  $\mathfrak{D}^{G}\Psi : \operatorname{int}(\operatorname{efd}(\Psi)) \to \mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi)))$  is a bijection, with  $(\mathfrak{D}^{G}\Psi)^{-|} = J_{X}^{-|} \circ \mathfrak{D}^{G}\Psi^{F}$ . If  $(X, \|\cdot\|_{X})$  is reflexive, and  $\Psi \in \Gamma(X, \|\cdot\|_{X})$  is essentially Gateaux differentiable, then  $\mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) = \operatorname{int}(\operatorname{efd}(\Psi^{F}))$  and  $(\mathfrak{D}^{G}\Psi)^{-|} = \mathfrak{D}^{G}\Psi^{F}$ .

If  $(X,\|\cdot\|_X)$  is reflexive, then  $\Psi\in\Gamma(X,\|\cdot\|_X)$  is essentially Gateaux differentiable iff  $\Psi^{\mathbf{F}}$  is essentially strictly convex [40, Thm. 5.4], hence [40, Cor. 5.5]  $\Psi$  is Euler–Legendre iff  $\Psi^{\mathbf{F}}$  is Euler–Legendre. Furthermore, if  $(X,\|\cdot\|_X)$  is reflexive, and  $\Psi\in\Gamma(X,\|\cdot\|_X)$ , then  $\Psi$  is Euler–Legendre iff  $\Psi\in\Gamma^G(X,\|\cdot\|_X)$ ,  $\mathrm{efd}(\mathfrak{D}^G\Psi)=\mathrm{int}(\mathrm{efd}(\Psi)),\ \Psi^{\mathbf{F}}\in\Gamma^G(X^\star,\|\cdot\|_{X^\star}),\ \mathrm{efd}(\mathfrak{D}^G\Psi^{\mathbf{F}})=\mathrm{int}(\mathrm{efd}(\Psi^{\mathbf{F}}))$  [290, §2.1].  $\Psi\in\Gamma(X,\|\cdot\|_X)$  is uniformly Gateaux differentiable (resp., uniformly convex) on X iff  $\Psi^{\mathbf{F}}$  is uniformly convex (resp., uniformly Gateaux differentiable) on  $X^\star$  [34, Cor. 2.8]. If  $(X,\|\cdot\|_X)$  is reflexive,  $\Psi\in\Gamma(X,\|\cdot\|_X)$ , and  $\mathrm{int}(\mathrm{efd}(\Psi))\neq\varnothing$  (resp.,  $\mathrm{int}(\mathrm{efd}(\Psi^{\mathbf{F}}))\neq\varnothing$ ), then  $\Psi$  is uniformly Fréchet differentiable on  $\mathrm{int}(\mathrm{efd}(\Psi))$  (resp., uniformly convex on X) iff  $\Psi^{\mathbf{F}}$  is uniformly convex on  $X^\star$  (resp., uniformly Fréchet differentiable on  $\mathrm{int}(\mathrm{efd}(\Psi^{\mathbf{F}}))$  [359, Thm. 2.2].

# 2.1.2 Vaĭnberg-Brègman functional

Dependently on a purpose, the  $Vainberg-Brègman\ functional$  on  $(X, \|\cdot\|_X)$  is defined either as [83, Eqn. (2)]

$$D_{\Psi}^{+}: X \times X \ni (x,y) \mapsto \begin{cases} \Psi(x) - \Psi(y) - \mathfrak{D}_{+}^{G} \Psi(y; x - y) & : y \in \text{efd}(\Psi) \\ \infty & : \text{otherwise} \end{cases} \in [0, \infty], \tag{22}$$

for any  $\Psi \in \Gamma(X, \|\cdot\|_X)$ , or as [329, Eqn. (8.5)]

$$D_{\Psi}: X \times X \ni (x, y) \mapsto \begin{cases} \Psi(x) - \Psi(y) - [[x - y, \mathfrak{D}^{G}\Psi(y)]]_{X \times X^{\star}} & : y \in \text{int}(\text{efd}(\Psi)) \\ \infty & : \text{otherwise} \end{cases} \in [0, \infty], (23)$$

for any  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ . (Nonnegativity of a codomain of  $D_{\Psi}^+$  and  $D_{\Psi}$  follows from convexity of  $\Psi$ .) Definition (23) implies  $\forall \Psi, \Psi_1, \Psi_2 \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X) \ \forall x, y \in \mathrm{int}(\mathrm{efd}(\Psi)) \ \forall z, w \in X \ \forall \lambda_1, \lambda_2 \geq 0 \ \forall \lambda_3, \lambda_4 \in \mathbb{R}$ 

$$\Psi_3(x) := \lambda_3 x + \lambda_4 \quad \Rightarrow \quad D_{\lambda_1 \Psi_1 + \lambda_2 \Psi_2 + \Psi_3} = \lambda_1 D_{\Psi_1} + \lambda_2 D_{\Psi_2} \quad [66, \text{ p. 16}], \tag{24}$$

$$D_{\Psi}(x,y) + D_{\Psi}(y,x) = \left[ \left[ x - y, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(y) \right] \right]_{X \times X^{*}} [90, \text{ p. } 328],$$

$$D_{\Psi}(z,x) = D_{\Psi}(z,y) + D_{\Psi}(y,x) - \left[ \left[ z - y, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(y) \right] \right]_{X \times X^{*}} [99, \text{ Lemm. } 3.1],$$
(26)

$$D_{\Psi}(z,x) + D_{\Psi}(w,y) = D_{\Psi}(z,y) + D_{\Psi}(w,x) - \left[ \left[ z - w, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(y) \right] \right]_{X \times X^{*}}$$
 [44, Rem. 3.5]. (27)

 $<sup>^9</sup>$ [239, Eqn. (1)] considered convex  $\Psi: \mathbb{R} \to \mathbb{R}$  and  $X = \mathbb{R}$ , while [140, p. 75] considered convex and lower semicontinuous  $\Psi: K \to [0, \infty]$  with  $\lim_{x \to y} \Psi(x) = \infty \ \forall y \in \operatorname{cl}(K) \setminus \operatorname{int}(K)$ , as well as  $\sup_{x \in K} \{\ldots\}$  instead of  $\sup_{x \in X} \{\ldots\}$ , for a convex  $\emptyset \neq K \subseteq \mathbb{R}^n$ . [239, p. 69] contains an error, asserting that  $\Upsilon^{\mathbf{Y}}$  is a convex real valued function for any convex function  $\Upsilon: \mathbb{R} \to \mathbb{R}$  (cf. [140, Footn. 1]). [257, p. 8] introduced (20) in a full form. In subsequent references we list first Fenchel's result for  $K \subseteq \mathbb{R}^n$  (if available), and then its generalisation to  $(X, \|\cdot\|_X)$ .

Equations (24)–(27) hold also for  $D_{\Psi}$  (resp.,  $[[\cdot, \mathfrak{D}^{G}\Psi(y)]]_{X\times X^{\star}}$ ) replaced by  $D_{\Psi}^{+}$  (resp.,  $\mathfrak{D}_{+}^{G}\Psi(y, \cdot)$ ). Equation (25) implies the formula for the class of Vaĭnberg–Brègman functionals that are symmetric with respect to interchange of variables:  $\forall x, y \in \text{int}(\text{efd}(\Psi))$ 

$$D_{\Psi}(x,y) = D_{\Psi}(y,x) \iff D_{\Psi}(x,y) = \frac{1}{2} \left[ \left[ x - y, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(y) \right] \right]_{X \times X^{*}}. \tag{28}$$

Comparison of (23) with (16), while applying the equality case of (21), gives

$$D_{\Psi}(x,y) = \Psi(x) + \Psi^{\mathbf{F}}(\mathfrak{D}^{G}\Psi(y)) - [[x,\mathfrak{D}^{G}\Psi(y)]]_{X \times X^{*}} \quad \forall (x,y) \in X \times \operatorname{int}(\operatorname{efd}(\Psi)).$$
 (29)

When equipped with an additional condition,  $D_{\Psi}(x,y) = \infty \ \forall (x,y) \in X \times (X \setminus \operatorname{int}(\operatorname{efd}(\Psi))), (29) \text{ becomes a definition of } D_{\Psi} \text{ equivalent to (23)}.$  If  $\Psi^{\mathbf{F}}$  is Gateaux differentiable on  $\varnothing \neq \mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})), \text{ then [40, Lemm. 7.3] [235, Lemm. 3.2]}$ 

$$D_{\Psi}(x,y) = D_{\Psi^{\mathbf{F}}}(\mathfrak{D}^{\mathbf{G}}\Psi(y), \mathfrak{D}^{\mathbf{G}}\Psi(x)) \quad \forall x, y \in \operatorname{int}(\operatorname{efd}(\Psi)).$$
(30)

 $D_{\Psi}$  is said to be **jointly convex** [39, §1] iff  $(x, y) \mapsto D_{\Psi}(x, y)$  is convex on  $\operatorname{int}(\operatorname{efd}(\Psi)) \times \operatorname{int}(\operatorname{efd}(\Psi))$ .  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is called: **totally convex** at  $x \in \operatorname{efd}(\Psi)$  iff [82, 2.2] [83, p. 62]

$$\nu_{\Psi}(x,t) := \inf\{D_{\Psi}^{+}(y,x) : y \in \operatorname{efd}(\Psi), \|y - x\|_{X} = t\} > 0 \ \forall t \in ]0,\infty[, \tag{31}$$

or, equivalently [294, Prop. 2.2], iff

$$\lim_{n \to \infty} D_{\Psi}^{+}(y_n, x) = 0 \Rightarrow \lim_{n \to \infty} \|y_n - x\|_X = 0 \quad \forall \{y_n \in \operatorname{efd}(\Psi) : n \in \mathbb{N}\};$$
 (32)

totally convex on bounded subsets of X [84, Lemm. 2.1.2] iff

$$\inf\{\nu_{\Psi}(x,t): x \in Y \cap \operatorname{efd}(\Psi)\} > 0 \ \forall t \in ]0, \infty[ \ \forall \text{ bounded } \varnothing \neq Y \subseteq X.$$
 (33)

If  $\operatorname{efd}(\Psi) \neq \{*\}$ , then (33) is equivalent [85, Prop. 4.2] to **sequential consistency** of  $\Psi$ , defined as [90, Def. 2.1.(vi)] [83, Cor. 4.9.(iii)]  $\forall \{y_n \in \operatorname{efd}(\Psi) : n \in \mathbb{N}\} \forall \text{ bounded } \{x_n \in \operatorname{efd}(\Psi) : n \in \mathbb{N}\}$ 

$$\lim_{n \to \infty} D_{\Psi}(y_n, x_n) = 0 \quad \Rightarrow \quad \lim_{n \to \infty} \|y_n - x_n\|_X = 0. \tag{34}$$

#### 2.1.3 Monotone maps

If  $(X, \|\cdot\|_X)$  is a Banach space, then the **graph** of  $T: X \to 2^{X^*}$  is given by  $\operatorname{graph}(T) := \{(x, y) \in X \times X^* : y \in T(X)\}$ , while  $T^{-1}(y) := \{x \in X : y \in T(x)\} \ \forall y \in X^*$ . If, furthermore,  $\emptyset \neq K \subseteq \operatorname{efd}(T)$ , then T is called: **monotone** on K iff [334, Thm. 7] [184, Eqn. (1)] [355, p. 0] [252, p. 341]

$$[x - y, v - w]_{X \times X^*} \ge 0 \ \forall x, y \in K \ \forall v \in T(x) \ \forall w \in T(y); \tag{35}$$

strictly monotone on K iff

$$x \neq y \quad \Rightarrow \quad [x - y, v - w]_{X \times X^*} > 0 \ \forall x, y \in K \ \forall v \in T(x) \ \forall w \in T(y); \tag{36}$$

strongly monotone on K iff [355, p. 12]  $\exists \lambda > 0$ 

$$[x - y, v - w]_{X \times X^*} \ge \lambda ||x - y||_X^2 \ \forall x, y \in K \ \forall v \in T(x) \ \forall w \in T(y); \tag{37}$$

f-uniformly monotone on K iff [330, p. 203] there exists a strictly increasing  $f: \mathbb{R}^+ \to \mathbb{R}^+$  with f(0) = 0 such that

$$[x - y, v - w]_{X \times X^*} \ge ||x - y||_X f(||x - y||_X) \ \forall x, y \in K \ \forall v \in T(x) \ \forall w \in T(y);$$
(38)

maximally monotone on K iff it is monotone on K and its graph is not contained in the graph of any other map from X to  $2^{X^*}$  that is monotone on K. For any Banach space  $(X, \|\cdot\|_X)$ , if  $f \in \Gamma(X, \|\cdot\|_X)$ , then  $\partial f$  is maximally monotone [300, Thm. 4] [302, Thm. A].

# 2.1.4 Remarks and examples

Remark 2.1. (i) Transformation d(z(x,y) - px - qy) = -xdp - ydq, with  $p = \frac{\partial z(x,y)}{\partial x}$  and  $q = \frac{\partial z(x,y)}{\partial y}$ , was introduced by Euler [135, Part I, Probl. 11] and Legendre [216, p. 347]. Since Legendre's work appeared 17 years later then Euler's, it seems to be adequate to include Euler in the terminology. Under generalisation to  $\mathbb{R}^n$ , the **Euler-Legendre transformation**  $(\Psi, \theta) \mapsto (\Psi^{\mathbf{L}}, \eta)$  of a strictly convex and differentiable function  $\Psi : \mathbb{R}^n \to \mathbb{R}$  is defined by

$$\begin{cases}
\eta := \operatorname{grad}\Psi(\theta) \,\forall \theta \in \mathbb{R}^n \\
\Psi^{\mathbf{L}}(\eta) := \llbracket \eta, \theta \rrbracket_{\mathbb{R}^n \times \mathbb{R}^n} - \Psi(\theta) = \llbracket [\eta, (\operatorname{grad}\Psi)^{-\mathsf{I}}(\eta) \rrbracket \rrbracket_{\mathbb{R}^n \times \mathbb{R}^n} - \Psi((\operatorname{grad}\Psi)^{-\mathsf{I}})(\eta)) \,\forall \eta \in \mathbb{R}^n,
\end{cases} (39)$$

with its inverse given by

$$\begin{cases} \theta = \operatorname{grad}(\Psi^{\mathbf{L}})(\eta) \\ \Psi = \Psi^{\mathbf{LL}}. \end{cases}$$
 (40)

If one restricts the domain of  $\Psi$  to an open set  $U \subseteq \mathbb{R}^n$  and allows  $\Psi$  to take infinite values, there appears a question about the optimal conditions to be imposed on  $\Psi$  to guarantee uniqueness of transformation in both directions, while preserving structural symmetry between  $\Psi$  and  $\Psi^{\mathbf{L}}$ . Following a remark in [140, p. 77], Rockafellar [297, Thm. C-K] [299, Thm. 1] showed that if  $\emptyset \neq U \subseteq \mathbb{R}^n$  is open and convex, while  $\Psi: U \to ]-\infty, \infty$ ] is strictly convex, differentiable on U, and satisfies

$$\lim_{t \to +0} \frac{\mathrm{d}}{\mathrm{d}t} \Psi(tx + (1-t)y) = -\infty \ \forall (x,y) \in U \times (\mathrm{cl}(U) \setminus U), \tag{41}$$

then grad $\Psi$  is a bijection on U, grad $(\Psi^{\mathbf{F}}) = (\operatorname{grad}\Psi)^{-1}$  on  $\operatorname{grad}\Psi(U)$ , and  $\Psi^{\mathbf{F}}$  satisfies on  $\operatorname{grad}(U)$  the same conditions as  $\Psi$  on U. The notion of (Euler–)Legendre function introduced in [40, Def. 5.2.(iii)] reduces to Rockafellar's for  $X = \mathbb{R}^n$  [40, Thm. 5.11.(iii)]. See [59] for an extension of essentially Gateaux differentiable and Euler–Legendre functions to nonreflexive Banach spaces, as well as to other types of differentiability. On the other hand, strengthening to essential Fréchet differentiability and, correspondingly, to Fréchet–(Euler–)Legendre functions was developed in [61, 319, 339].

(ii) For  $y \in \text{int}(\text{efd}(\Psi))$ , the function (23) was introduced by Vaĭnberg in [329, Eqn. (8.5)]<sup>10</sup>, already at the Banach space level of generality (and, as such, it was further discussed in a series of works by Vaĭnberg [331, Lemm. 1] [332, Lemm. 6.1] [333, Eqn (0.1)] and Kachurovskiĭ [185, Thm. 3]). For  $X = \mathbb{R}$ , (23) appeared independently in [78, Eqn. (4.1)], in the context of the problem of minimisation of

$$D_{\Psi}^{\mu}(x,y) := \int_{\mathcal{X}} \mu(\chi) D_{\Psi}(x(\chi), y(\chi)), \tag{42}$$

for  $x, y : \mathcal{X} \to \mathbb{R}$  with  $\mathcal{X} \subseteq \mathbb{R}^n$ , over a measure space  $(\mathbb{R}^n, \mho_{\mathrm{Borel}}(\mathbb{R}^n), \mu)$ , considered in [78, Thm. 4.2]. Independently, (23) appeared in [65, p. 1021] and [67, Eqn. (1.4)] (=[66, Eqn. (2.1)]) for  $X = \mathbb{R}^n$  (with a convex set  $\varnothing \neq C \subseteq \mathbb{R}^n$ , and with  $\Psi : C \to \mathbb{R}$  differentiable on C and strictly convex), where it was used in the context of minimisation of  $D_{\Psi}$ . Attribution of the name 'Brègman' to  $D_{\Psi}$  and  $D_{\Psi}^+$  goes back to [90, §2]. Correspondingly, it is fair to call  $D_{\Psi}^{\mu}$  the  $\operatorname{Brunk-Ewing-Utz}$  functional. It has been further investigated in [183, 182], and, under generalisation to any countably finite measure space, in [109, 110, 111, 112, 113].

- (iii) The function (23), and its related properties, can be further generalised to  $D_{\Psi}^{\partial}$  by replacing  $\mathfrak{D}^{G}\Psi$  by a function  $\mathfrak{D}^{\partial}\Psi$ , defined as a selection from the set  $\partial\Psi$  ranging over  $\mathrm{efd}(\Psi)$  (instead of assuming that this set is globally a singleton). See [196, 197, 193, 81, 317] for further discussion of this direction.
- (iv) If  $k \in \mathbb{N}$ ,  $\Psi_i : \mathbb{R}^{n_i} \to ]-\infty, \infty]$  is Euler–Legendre (resp., totally convex with  $\bigcap_{i=1}^k \operatorname{efd}(\Psi_i) \neq \varnothing$ )  $\forall i \in \{1, \ldots, k\}$  and  $\lambda_i > 0 \ \forall i \in \{1, \ldots, k\}$ , then  $\Psi : \prod_{i=1}^k \mathbb{R}^{n_i} \to ]-\infty, \infty]$ , defined by  $\Psi = \sum_{i=1}^k \lambda_i \Psi_i$ , is Euler–Legendre [38, Cor. 5.13] (resp., totally convex [84, Prop. 1.2.7]). In such case  $D_{\Psi} = \sum_{i=1}^k \lambda_i D_{\Psi_i}$  [89, Lemm. 3.1]. Examples 2.2.(i)–(v) provide special cases of both these theorems in action, while  $\Psi$  in Example 2.2.(vi) is both Euler–Legendre and totally convex, but not decomposable into a weighted sum of  $\Psi_i$ .

<sup>&</sup>lt;sup>10</sup>Numbered as Eqn. (8.4) in the English translation of this book.

**Example 2.2.** (i) Let  $\Psi(x) = \sum_{i=1}^{n} \gamma |x_i|^{1/\gamma} =: \gamma \|x\|_{1/\gamma}^{1/\gamma}$  on  $X = \text{efd}(\Psi) = \mathbb{R}^n, \ \gamma \in ]0,1[$ . This implies  $\Psi^{\mathbf{F}}(y) = (1-\gamma)\|y\|_{1/(1-\gamma)}^{1/(1-\gamma)}$  [301, p. 106] [131, Ex.2].  $\Psi$  is Euler–Legendre [38, Ex. 6, Cor. 5.13]. From grad $\Psi(x) = \sum_{i=1}^{n} \text{sgn}(x_i)|x_i|^{1/\gamma-1}$  outside of the points where  $x_j = 0$  for some  $j \in \{1, \ldots, n\}$ , it follows that  $\forall x \in \mathbb{R}^n \ \forall y \in \mathbb{R}^n \setminus \{(y_1, \ldots, y_n) \in \mathbb{R}^n : \exists i \in \{1, \ldots, n\} \ y_i = 0\}$ 

$$D_{\Psi}(x,y) = \sum_{i=1}^{n} \left( \gamma |x_i|^{1/\gamma} - \gamma |y_i|^{1/\gamma} - (x_i - y_i)|y_i|^{1/\gamma - 1} \operatorname{sgn}(y_i) \right)$$
(43)

 $D_{\Psi}$  is jointly convex only for  $\gamma \in ]0, \frac{1}{2}]$  [39, Ex. 4.2].

(ii) Let  $\Psi(x) = \sum_{i=1}^{n} (x_i \log(x_i) - x_i)$  if  $x \geq 0$  and  $\infty$  otherwise (with  $0 \log 0 \equiv 0$ ). This implies  $\operatorname{int}(\operatorname{efd}(\Psi)) = (\mathbb{R}^n)_0^+ := \{x \in \mathbb{R}^n : x_i > 0 \ \forall i \in \{1, \dots, n\}\}, \operatorname{grad}\Psi(x) = \log(x), \text{ and } \Psi^{\mathbf{F}}(y) = \exp(y) \text{ (cf., e.g., [301, p. 105])}. \Psi \text{ is Euler-Legendre [38, Ex. 6.5, Cor. 5.13]}. D_{\Psi} \text{ is equal to [65, p. 1021]} (=[66, p. 15]) the finite dimensional denormalised <math>\operatorname{Kullback-Leibler}$  information [210, Eqn. (2.4)],

$$D_{\Psi}(x,y) = \sum_{i=1}^{n} (y_i - x_i + x_i(\log(x_i) - \log(y_i)))$$
(44)

for  $(x,y) \in (\mathbb{R}^n)^+ \times (\mathbb{R}^n)_0^+$  and  $\infty$  otherwise.  $D_{\Psi}$  is jointly convex (cf., e.g., [39, p. 34]) and satisfies  $D_{\Psi}(\lambda x, \lambda y) = \lambda D_{\Psi}(x,y) \ \forall \lambda > 0$ .  $\Psi$  is totally convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$  [82, Prop. 2.5.(i)] [58, Prop. 9] and supercoercive.

Convex closed subsets  $C \subseteq X$  with  $C \cap \operatorname{int}(\operatorname{efd}(\Psi))$  are right  $D_{\Psi}$ -Chebyshëv<sup>11</sup> [46, Ex.2.16.(ii)]. For any nonempty, closed, convex  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ,  $\overline{\mathfrak{P}}_{K}^{D_{\Psi}}$  is continuous [82, Lemm. 3.1]. If  $(\mathbb{R}^{n})_{1}^{+} := \{x \in (\mathbb{R}^{n})^{+} : \|x\|_{1} = 1\}$ , and  $x, y \in (\mathbb{R}^{n})_{0}^{+}$  such that  $\|x\|_{1} = \|y\|_{1} < 1$ , then  $D_{\Psi}(\overline{\mathfrak{P}}_{(\mathbb{R}^{n})_{1}^{+}}^{D_{\Psi}}(x), \overline{\mathfrak{P}}_{(\mathbb{R}^{n})_{1}^{+}}^{D_{\Psi}}(y)) > D_{\Psi}(x, y)$ , which implies that  $\overline{\mathfrak{P}}_{(\mathbb{R}^{n})_{1}^{+}}^{D_{\Psi}}$  is not an element of  $\operatorname{CN}(\Psi)$  [84, 2.1.7]. Furthermore, there is no  $\Psi: \mathbb{R}^{n} \to ]-\infty, \infty$ ] such that  $D_{\Psi}(x, y) = D_{\tilde{\Psi}}(y, x) \ \forall x, y \in \operatorname{int}(\operatorname{efd}(\Psi))$  [46, Prop. 3.3], hence left and right  $D_{\Psi}$ -projections not only do not coincide, but also have to be considered as a priori independent notions. For n = 2,  $C = \{(e^{\lambda}, e^{2\lambda}) : \lambda \in [0, 1]\}$  is a nonconvex right  $D_{\Psi}$ -Chebyshëv set with convex  $(\operatorname{grad}\Psi)(C)$  [47, Ex. 7.5].

(iii) Let  $\Psi(x) = -\sum_{i=1}^{n} \log(x_i)$  on  $\operatorname{efd}(\Psi) = (\mathbb{R}^n)_0^+$  and  $\infty$  otherwise. This gives  $\operatorname{grad}\Psi(x) = -\frac{1}{x}$  and  $\Psi^{\mathbf{F}}(y) = -\sum_{i=1}^{n} \log(-y_i) - n$  on  $\operatorname{efd}(\Psi^{\mathbf{F}}) = -\infty$ ,  $0[^n$ , and thus [91, Eqn. (57)]  $D_{\Psi}$  is equal to the **Pinsker information** [276, Eqn. (4)] [277, Eqn. (10.5.4)]<sup>13</sup>,

$$D_{\Psi}(x,y) = \sum_{i=1}^{n} \left( -\log \frac{x_i}{y_i} + \frac{x_i}{y_i} - 1 \right) \quad \forall (x,y) \in (\mathbb{R}^n)_0^+ \times (\mathbb{R}^n)_0^+. \tag{45}$$

Ψ is Euler-Legendre [38, Ex. 6.7, Cor. 5.13] [287, §8.1].  $D_{\Psi}$  is not jointly convex [39, Thm. 3.11.(i), Ex. 3.14]. It satisfies  $D_{\Psi}(\lambda x, \lambda y) = D_{\Psi}(x, y) \, \forall \lambda > 0$ .

(iv) Let  $\Psi(x) = \sum_{i=1}^{n} (x_i \log(x_i) + (1-x_i) \log(1-x_i))$  on  $\operatorname{efd}(\Psi) = [0,1]^n$  and  $\infty$  otherwise [190, Eqn. (60)].  $\Psi^{\mathbf{F}}(y) = \log(1+\exp(y))$  on  $\operatorname{efd}(\Psi^{\mathbf{F}}) = \mathbb{R}^n$ , and  $(\operatorname{grad}\Psi(y))_i = \log\left(\frac{y_i}{1-y_i}\right)$ .  $\Psi$  is Euler–Legendre [38, Ex. 6.6, Cor. 5.13] and totally convex [58, Prop. 11]. The resulting Vaĭnberg–Brègman functional reads [194, p. 142]

$$D_{\Psi}(x,y) = \sum_{i=1}^{n} \left( x_i \log \left( \frac{x_i}{y_i} \right) + (1 - x_i) \log \left( \frac{1 - x_i}{1 - y_i} \right) \right), \tag{46}$$

and it is jointly convex [39, Ex. 3.5]. Convex closed subsets  $C \subseteq X$  with  $C \cap \operatorname{int}(\operatorname{efd}(\Psi))$  are right  $D_{\Psi}$ -Chebyshëv [46, Ex. 2.16.(iii)].

<sup>11</sup>For the notion of right  $D_{\Psi}$ -Chebyshëv set, and other yet undefined notions contained in the current Example, see

<sup>&</sup>lt;sup>12</sup>The works of Burg, usually referenced in this context, consider only the continuous analogue of this  $\Psi$ , given by  $x \mapsto -\int_{t_1}^{t_2} dt \log(x(t)), t_1, t_2 \in \mathbb{R}$  [79, Slide 6] [80, p. 1].

<sup>&</sup>lt;sup>13</sup>As opposed to [276, Eqn. (4)] [277, Eqn. (10.5.4)], the paper by Itakura and Saito, usually referenced for this  $D_{\Psi}$ , contains only a formula  $2\log(2\pi) + \frac{1}{2\pi} \int_{-\pi}^{\pi} dt (\log(y(t)) + \frac{x(t)}{y(t)})$  [171, Eqn. (7)].

(v) Let

$$\Psi(x) = \Psi_{\alpha}(x) := \begin{cases} \frac{1}{\alpha - 1} \sum_{i=1}^{n} (x_{i}^{\alpha} - 1) & : x \in [0, \infty[^{n}, \alpha \in ]0, 1[\\ \frac{1}{1 - \alpha} \sum_{i=1}^{n} (x_{i}^{\alpha} - 1) & : x \in ]0, \infty[^{n}, \alpha \in ]-\infty, 0[ & [287, \text{ Eqn. } (37)]. \end{cases}$$

$$(47)$$

$$\infty \quad : \text{ otherwise}$$

 $\Psi_{\alpha}$  is Euler-Legendre [287, §7.2], and gives [287, Eqn. (38)]

$$D_{\Psi_{\alpha}}(x,y) = \begin{cases} \frac{1}{1-\alpha} \sum_{i=1}^{n} (-x_{i}^{\alpha} + (1-\alpha)y_{i}^{\alpha} + \alpha y_{i}^{\alpha-1}x_{i}) & : (x,y) \in (\mathbb{R}^{n})^{+} \times (\mathbb{R}^{n})_{0}^{+}, \ \alpha \in ]0,1[\\ \frac{1}{\alpha-1} \sum_{i=1}^{n} (-x_{i}^{\alpha} + (1-\alpha)y_{i}^{\alpha} + \alpha y_{i}^{\alpha-1}x_{i}) & : (x,y) \in (\mathbb{R}^{n})_{0}^{+} \times (\mathbb{R}^{n})_{0}^{+}, \ \alpha \in ]-\infty,0[\\ \infty & : \text{ otherwise.} \end{cases}$$

 $-\frac{2^{\alpha-1}}{2^{\alpha-1}-1}(\alpha-1)\Psi_{\alpha} \text{ with } \alpha>0 \text{ (resp., } -\Psi_{\alpha} \text{ with } \alpha\in\mathbb{R}) \text{ was introduced in [160, Thm. 1]}$  (resp., [325, Eqn. (1)]). Denoting by  $D_{\hat{\Psi}_{\alpha}}$  the first case in (48),  $\frac{\alpha-1}{\alpha}D_{\hat{\Psi}_{\alpha}}$  with  $\alpha>1$  (resp.,  $(1-\alpha)D_{\hat{\Psi}_{\alpha}}$  for  $\alpha\in]-\infty,0[\cup]0,1[; D_{\hat{\Psi}_{\alpha}}$  for  $\alpha\in]0,1[)$  was introduced in [183, Eqn. (7)] (resp., [108, Thm.4] and [109, Eqns. (1.7), (1.8), (1.12)]; [321, Ex. 3.1.3]). Since  $D_{\Psi}$  is invariant under addition of affine function to  $\Psi$ , and scales linearly under positive linear scaling of  $\Psi$ , there are several closely related functions  $\Psi$ , giving rise to the same  $D_{\Psi_{\alpha}}$  (or  $D_{\hat{\Psi}_{\alpha}}$ ), up to a positive scaling. For example,  $\Psi(x)=\frac{1}{\alpha(\alpha-1)}\sum_{i=1}^n(x_i^{\alpha}-\alpha x_i+\alpha-1)$  [223, Eqn. (2.1)] or  $\Psi(x)=\frac{1}{\alpha-1}\sum_{i=1}^n(x_i^{\alpha}-\alpha x_i)$  [321, Ex. 3.1.3]. In particular,  $\Psi(x)=\frac{1}{\alpha(1-\alpha)}\sum_{i=1}^nx^{\alpha}$  is Euler–Legendre for  $(x,\alpha)\in(\mathbb{R}^n\times]1,\infty)\cup((\mathbb{R}^n)^+\times]0,1[)\cup((\mathbb{R}^n)^+\times]-\infty,0[)\cup(-(\mathbb{R}^n)^+\times]0,1[)\cup(-(\mathbb{R}^n)^+\times]-\infty,0[)$  [345, Thm.5].

(vi) Let  $\Psi(x) = \frac{1}{2} \|x\|_{1/\gamma}^2 = \frac{1}{2} \left( \sum_{i=1}^n |x_i|^{1/\gamma} \right)^{2\gamma}$  on  $efd(\Psi) = \mathbb{R}^n$  for  $\gamma \in [\frac{1}{2}, 1[$  [263, Eqn. (III.2.2)] [48, §8]. This gives  $(\operatorname{grad}\Psi(y))_i = \operatorname{sign}(y_i) |y_i|^{1/\gamma - 1} \|y\|_{1/\gamma}^{2-1/\gamma}$  outside the points where  $y_i = 0$ , and thus [195, p. 1784]  $\forall (x,y) \in \mathbb{R}^n \times (\mathbb{R}^n \setminus \{(y_1, \dots, y_n) \in \mathbb{R}^n : \exists i \in \{1, \dots, n\} \ y_i = 0\})$ 

$$D_{\Psi}(x,y) = \frac{1}{2} \|x\|_{1/\gamma}^2 - \frac{1}{2} \|y\|_{1/\gamma}^2 - \|y\|_{\gamma}^{2-1/\gamma} \sum_{i=1}^n (x_i - y_i) \operatorname{sign}(y_i) |y_i|^{1/\gamma - 1}.$$
 (49)

 $\Psi$  is strictly convex [48, Lemm. 8.1] (and this implies total convexity), as well as supercoercive and Euler-Legendre [287, §11.3].

Example 2.3. Given a Hilbert space  $\mathcal{H}$  with  $\dim \mathcal{H} < \infty$ ,  $\mathcal{K} := (\mathfrak{G}_2(\mathcal{H}))^{\operatorname{sa}} := \{x \in \mathfrak{B}(\mathcal{H}) : \sqrt{\operatorname{tr}_{\mathcal{H}}(x^*x)} \leq \infty, \ x = x^*\}$  with  $\dim \mathcal{K} =: n$ , equipped with an inner product  $\langle x,y\rangle_{\mathcal{K}} := \operatorname{tr}_{\mathcal{H}}(xy) \forall x,y \in \mathcal{K}$ , becomes a real Hilbert space of  $n \times n$  self-adjoint matrices. Let  $S_n$  denote the group of all  $n \times n$  permutation matrices  $\mathbb{R}^n \to \mathbb{R}^n$  (representing the group of all bijections of the set  $\{1,\ldots,n\}$  into itself), called a *symmetric group*, and let  $U_n$  denote the group of all  $n \times n$  unitary matrices  $\mathcal{K} \to \mathcal{K}$ , called a *unitary group*. For  $x \in \mathcal{K}$ , let  $\lambda(x) := (\lambda_1(x),\ldots,\lambda_n(x)) \in \mathbb{R}^n$  denote the vector of eigenvalues of x ordered nonincreasingly. For any  $n \times n$  matrix x (resp., for  $x \in \mathbb{R}^n$ ), let diag(x) denote the diagonal matrix with elements given by a diagonal of x (resp., by elements of x). Given  $C \subseteq \mathbb{R}^n$ ,  $\lambda^{-1}(C) := \{x \in \mathcal{K} : \lambda(x) \in C\}$  is called a *spectral set*. If  $s(C) = C \ \forall s \in S_n$ , then  $\lambda^{-1}(C)$  is closed (resp., convex) iff C is closed (resp., convex) [221, Thm. 8.4]. A function  $f : \mathbb{R}^n \to ] - \infty, \infty$ ] will be called *symmetric*, and  $f \circ \lambda : \mathcal{K} \to ] - \infty, \infty$ ] will be called *spectral*, iff  $f(s(x)) = f(x) \ \forall s \in S_n$ . For any symmetric f,  $f \circ \lambda$  is convex iff f is convex [115, Thm. (p. 276)]. Furthermore, for any symmetric f [220, Thm. 2.3, Cor. 2.4, Cor. 3.2, Cor. 3.3] [221, Thm. 8.1, Thm. 5.4] [38, Fact 7.14, Prop. 7.19.(ii)]:

- 1)  $f^{\mathbf{F}}$  is symmetric;
- 2)  $f \in \Gamma(\mathbb{R}^n)$  iff  $f \circ \lambda \in \Gamma(\mathcal{K})$ ;  $(f \circ \lambda)(u^*xu) = (f \circ \lambda)(x) \ \forall x \in \mathcal{H} \ \forall u \in U_n$ ;
- 3)  $(f \circ \lambda)^{\mathbf{F}} = f^{\mathbf{F}} \circ \lambda$ ;
- 4) efd $(f \circ \lambda) = \lambda^{-1}(efd(f));$
- 5)  $\operatorname{int}(\operatorname{efd}(f \circ \lambda)) = \lambda^{-1}(\operatorname{int}(\operatorname{efd}(f)));$
- 6) if  $f \in \Gamma(\mathbb{R}^n)$ , then  $f \circ \lambda$  is differentiable at x iff f is differentiable at  $\lambda(x)$ ;
- 7) f is essentially strictly convex (resp., essentially Gateaux differentiable; Euler-Legendre) iff  $f \circ \lambda$  is essentially strictly convex (resp., essentially Gateaux differentiable; Euler-Legendre);

8) if  $f \in \Gamma(\mathbb{R}^n)$  and  $f \circ \lambda$  is differentiable at  $y \in \operatorname{int}(\operatorname{efd}(f \circ \lambda))$  then  $\operatorname{grad}(f \circ \lambda)(y) = v(\operatorname{diag}(\operatorname{grad}f(\lambda(y))))v^*$   $\forall v \in U_n$  such that  $v^*yv = \operatorname{diag}(\lambda(y))$ , and  $\operatorname{grad}(f \circ \lambda)(u^*yu) = u^*\operatorname{grad}(f \circ \lambda)(y)u \ \forall u \in U_n$ . In consequence,  $D_{\Psi}(x,y) = D_{\Psi}(u^*xu,u^*yu) \ \forall x \in \mathcal{K} \ \forall y \in \operatorname{int}(\operatorname{efd}(\Psi)) \ \forall u \in U_n$  for all spectral Euler– Legendre  $\Psi$  [38, Cor. 7.21].

The examples of symmetric Euler–Legendre functions are:

(i)  $f(x) = \sum_{i=1}^{n} \gamma |x_i|^{1/\gamma} =: \gamma \|x\|_{1/\gamma}^{1/\gamma}$  on  $\operatorname{efd}(f) = \operatorname{int}(\operatorname{efd}(f)) = \mathbb{R}^n$  for  $\gamma \in ]0,1[$ , which gives [220, p. 171] spectral Euler–Legendre  $(f \circ \boldsymbol{\lambda})(\xi) = \gamma \|\boldsymbol{\lambda}(\xi)\|_{1/\gamma}^{1/\gamma} = \sum_{i=1}^{n} \gamma |\boldsymbol{\lambda}_i(\xi)|^{1/\gamma} = \gamma \operatorname{tr}_{\mathcal{H}}(|\xi|^{1/\gamma}) = \gamma \|\xi\|_{1/\gamma}^{1/\gamma}$  on  $\operatorname{efd}(f \circ \boldsymbol{\lambda}) = \mathfrak{G}_2(\mathcal{H})$ . Under a restriction of a domain of  $\zeta$  to  $(\mathfrak{G}_2(\mathcal{H}))_0^+ = \{x \in \mathcal{K} : x \text{ is positive definite}\}$ , the corresponding Vaĭnberg–Brègman functional reads

$$D_{f \circ \lambda}(\xi, \zeta) = \operatorname{tr}_{\mathcal{H}}(\gamma |\xi|^{1/\gamma} - \gamma \zeta^{1/\gamma} - (\xi - \zeta) \zeta^{1/\gamma - 1}) \,\forall (\xi, \zeta) \in (\mathfrak{G}_{2}(\mathcal{H}))^{\operatorname{sa}} \times (\mathfrak{G}_{2}(\mathcal{H}))^{+}_{0}; \tag{50}$$

(ii)  $f(x) = \sum_{i=1}^{n} (x_i \log(x_i) - x_i)$  if  $x \geq 0$  and  $\infty$  otherwise, which gives [38, Ex. 7.29] spectral Euler-Legendre  $(f \circ \lambda)(\xi) = \operatorname{tr}_{\mathcal{H}}(\xi \log \xi - \xi)$  with  $\operatorname{efd}(f \circ \lambda) = (\mathfrak{G}_2(\mathcal{H}))^+ = \{x \in \mathcal{K} : x \text{ is positive semi-definite}\}$ ,  $\operatorname{int}(\operatorname{efd}(f \circ \lambda)) = (\mathfrak{G}_2(\mathcal{H}))^+_0$ , and  $\operatorname{grad}(f \circ \lambda)(\xi) = \log(\xi)$ . The corresponding Vaĭnberg-Brègman functional reads [326, Def. 1]

$$D_{f \circ \lambda}(\xi, \zeta) = \operatorname{tr}_{\mathcal{H}}(\xi(\log \xi - \log \zeta) - \xi - \zeta) \ \forall (\xi, \zeta) \in (\mathfrak{G}_{2}(\mathcal{H}))^{+} \times (\mathfrak{G}_{2}(\mathcal{H}))^{+}_{0}; \tag{51}$$

(iii)  $f(x) = -\sum_{i=1}^{n} \log(x_i)$  on  $\operatorname{efd}(f) = (\mathbb{R}^n)_0^+$  and  $\infty$  otherwise, which gives [220, pp. 170–171] spectral Euler–Legendre  $(f \circ \lambda)(\xi) = -\log \det(\xi) \ \forall \xi \in \operatorname{efd}(f \circ \lambda) = (\mathfrak{G}_2(\mathcal{H}))_0^+$  and  $\infty$  otherwise (cf., e.g., [264, Thm. 3.2.(iv)]). It satisfies  $\operatorname{grad}(f \circ \lambda)(\xi) = -\xi^{-1}$ . Its Mandelbrojt–Fenchel dual is  $(f \circ \lambda)^{\mathbf{F}}(\xi) = -n - \log \det(-\xi)$  on  $\operatorname{efd}((f \circ \lambda)^{\mathbf{F}}) = -(\mathfrak{G}_2(\mathcal{H}))_0^+$  [220, p. 171], and satisfies  $\operatorname{grad}((f \circ \lambda)^{\mathbf{F}})(\xi) = -\xi^{-1}$ . The corresponding Vaĭnberg–Brègman functional reads [175, §5]

$$D_{f \circ \lambda}(\xi, \zeta) = \langle \xi, \zeta^{-1} \rangle_{\mathcal{K}} - \log \det(\xi \zeta^{-1}) - n = h(\zeta^{-1/2} \xi \zeta^{-1/2}) - n, \tag{52}$$

for  $h(\xi) := \operatorname{tr}_{\mathcal{K}}(\xi) - \log \det(\xi)$ .

# 2.2 Vaĭnberg-Brègman projections and quasinonexpansive maps

#### 2.2.1 Projections

**Definition 2.4.** For any set Z,  $D: Z \times Z \to [0, \infty]$  will be called an **information** on Z (and -D will be called a **relative entropy** on Z) iff  $D(x, y) = 0 \iff x = y \ \forall x, y \in Z$ .

**Proposition 2.5.** Let  $\Psi \in \Gamma(X, \|\cdot\|_X)$ . Then:

- (i) If  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$ , then  $D_{\Psi}$  is an information on X iff  $\Psi$  is strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$  [84, Prop. 1.1.9].
- (ii) If  $(X, \|\cdot\|_X)$  is reflexive and  $\Psi$  is essentially strictly convex, then  $D_{\Psi}^+$  is an information on X [40, Lemm. 7.3.(vi)].

**Definition 2.6.** Let  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$ ,  $y \in \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $K \subseteq X$  with  $\emptyset \neq K \cap \operatorname{int}(\operatorname{efd}(\Psi))$ .

- (i) If the set  $\arg\inf_{x\in K}\{D_{\Psi}(x,y)\}$  is a singleton, then its element will be denoted  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y)$ , and called a **left**  $D_{\Psi}$ -**projection** of y onto K [65, p. 1019] [66, §1.II, §2.2] [67, p. 620], while K will be called a **left**  $D_{\Psi}$ -**Chebyshëv** set [41, Def. 3.28].
- (ii) If  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  and the set  $\operatorname{arg\,inf}_{x \in K} \{D_{\Psi}(y, x)\}$  is a singleton, then its element will be denoted  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y)$ , and called a **right**  $D_{\Psi}$ -**projection** of y onto K [46, Def. 3.1, Lemm. 3.5], while K will be called a **right**  $D_{\Psi}$ -**Chebyshëv** set [45, Def. 1.7].

 $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$ ) will be called **zone consistent** (with respect to the class of sets K which are under consideration) [90, Def. 3.1.(i)] iff  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  (resp.,  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ) for any K (in the given class).

**Definition 2.7.** Let  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$ ,  $\varnothing \neq K \subseteq X$ .  $D_{\Psi}$  will be called:

a) left pythagorean on K iff K is left  $D_{\Psi}$ -Chebyshëv and, for any  $x \in \text{int}(\text{efd}(\Psi))$  and any  $w \in K$ , the following conditions are equivalent:

- (i)  $w = \overleftarrow{\mathfrak{P}}_K^{D_{\Psi}}(x);$
- (ii) w is the unique solution of the variational inequality

$$[[z - y, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(z)]]_{X \times X^{\star}} \ge 0 \ \forall y \in K;$$
(53)

(iii) w is the unique solution of the variational inequality

$$D_{\Psi}(y,z) + D_{\Psi}(z,x) < D_{\Psi}(y,x) \quad \forall y \in K. \tag{54}$$

- b) right pythagorean on K iff K is right  $D_{\Psi}$ -Chebyshëv and, for any  $x \in \operatorname{int}(\operatorname{efd}(\Psi))$  and any  $w \in K$ , the following conditions are equivalent

  - (i)  $w = \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x);$ (ii) w is the unique solution of the variational inequality

$$[[x - z, \mathfrak{D}^{G}\Psi(x) - \mathfrak{D}^{G}\Psi(y)]]_{X \times X^{*}} \ge 0 \ \forall y \in K;$$
 (55)

(iii) w is the unique solution of the variational inequality

$$D_{\Psi}(x,z) + D_{\Psi}(z,y) \le D_{\Psi}(x,y) \quad \forall y \in K. \tag{56}$$

**Proposition 2.8.** Let  $(X, \|\cdot\|_X)$  be reflexive,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$  and  $\varnothing \neq K \subseteq X$  be closed and convex.

- (i) K is left  $D_{\Psi}$ -Chebyshëv, and  $D_{\Psi}$  is left pythagorean on K if any of (generally, inequivalent) conditions holds:
  - a)  $\Psi$  is totally convex on efd( $\Psi$ ),  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  [84, Prop. 2.1.5]+[87, Prop. 4.1.(i)](=[87, Cor. 4.4); or
  - b)  $\Psi$  is strictly convex on  $\operatorname{efd}(\Psi)$  and supercoercive,  $K \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$  [14, Prop. 2.2]+[87, Prop. 4.1.(ii)]; or
  - c)  $\Psi$  is Euler-Legendre,  $K \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$  [38, Prop. 3.16]+[40, Thm. 7.8](=[41, Cor.
- (ii) if any of the conditions a)-c) holds, and K is affine, then

$$D_{\Psi}(x, \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y)) + D_{\Psi}(\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y), y) = D_{\Psi}(x, y) \ \forall (x, y) \in K \times \operatorname{int}(\operatorname{efd}(\Psi)). \tag{57}$$

(iii) if (condition c) holds), or (condition a) or condition b) holds, and  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ), then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$ is zone consistent [40, Cor. 7.9].

Corollary 2.9. If any of the conditions in Proposition 2.8.(i) holds, then  $D_{\Psi}$  is an information on X.

*Proof.* The condition of strict convexity on  $efd(\Psi)$  in Proposition 2.8.(i).b) implies Proposition 2.5.(i). The condition of 2.8.(i).c) implies Proposition 2.5.(ii), which in turn implies that  $D_{\Psi}$  is an information on X. Since total convexity on  $efd(\Psi)$  implies strict convexity on  $int(efd(\Psi))$  [83, Prop. 3.1.(i)], the condition of Proposition 2.8.(i).a) implies Proposition 2.5.(i).

**Proposition 2.10.** [235, Lemm. 3.2] If  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$ ,  $\Psi^{\mathbf{F}}$  is Gateaux differentiable on  $\emptyset \neq \mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ ,  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\mathfrak{D}^{G}\Psi(K)$  is convex and closed, then

$$\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x) = (J_{X})^{-1} \circ \mathfrak{D}^{G} \Psi^{\mathbf{F}} \circ \overleftarrow{\mathfrak{P}}_{\mathfrak{D}^{G}\Psi(K)}^{D_{\Psi}\mathbf{F}} \circ \mathfrak{D}^{G} \Psi(x) \quad \forall x \in \operatorname{int}(\operatorname{efd}(\Psi)).$$
 (58)

Remark 2.11. (i) The notion of a  $Chebysh\ddot{e}v$  set, defined as a subset K of a Banach space  $(X,\|\cdot\|_X)$  such that  $\arg\inf_{x\in K}\{\|x-y\|_X\}=\{*\}=:\{\mathfrak{P}_K^{d_{\|\cdot\|_X}}(y)\}\ \forall y\in X,$  was introduced in [198, §A2] (implicitly) and [132, p. 17] (explicitly). This name refers to Chebyshëv's paper [96], where first nontrivial examples of such sets were considered. See Remarks 3.33.(iii), 3.33.(vii), and 3.33.(ix) for further discussion.

- (ii) In principle, Definitions 2.6 and 2.7 could be formulated more generally, by dropping an assumption  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$  and with  $D_{\Psi}$  (resp.,  $\mathfrak{D}^{G}\Psi$ ; int(efd( $\Psi$ ))) replaced either by  $D_{\Psi}^{+}$  (resp.,  $\mathfrak{D}^{G}\Psi$ ; efd( $\Psi$ )) or by  $D_{\Psi}^{0}$  (resp.,  $\mathfrak{D}^{\partial}\Psi$ ; efd( $\Psi$ )). (This is the reason for putting Gateaux differentiability into brackets in the third paragraph of Section 1.) While this is a tempting possibility in the context of a general axiomatic scheme, as well as in the light of references listed in Remark 2.1.(iii), there are currently no substantial geometric results available for such a degree of generality.
- (iii) Both left and right  $D_{\Psi}$ -projections are idempotent: if K is left (resp., right)  $D_{\Psi}$ -Chebyshëv, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}} \circ \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}} = \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}} \circ \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}} = \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$ ).

  (iv) The naming convention of Definition 2.4 follows Wiener's dictum that the «amount of information
- (iv) The naming convention of Definition 2.4 follows Wiener's dictum that the «amount of information is the negative of the quantity usually defined as entropy» [343, p. 76], and agrees with: Rényi's «measure of the amount of information» [293, p. 554], Umegaki's definition of «information» on state spaces of type I W\*-algebras as  $D_1(\rho,\sigma) = \operatorname{tr}_{\mathcal{H}}(\rho(\log \rho \log \sigma))$  [326, Def. 1] [327, Def. 1], Csiszár's definition of «relative information»  $D_{\mathfrak{f}}$  in [105, p. 86], as well as with the sign, ordering, and naming conventions used throughout [63]. It also avoids terminological confusions: when, e.g., both  $-\operatorname{tr}_{\mathcal{H}}(\rho\log\rho)$  and  $D_1(\rho,\sigma)$  are called an 'entropy' (sign ambiguity); when both  $D(\rho,\sigma)$  and  $D(\rho,\sigma) + D(\sigma,\rho)$  are called a 'divergence' (both [210, p. 81] and [327, Def. 2] explicitly distinguish between  $D_1$  and «divergence», the latter defined as a symmetrisation  $D_1(\rho,\sigma) + D_1(\sigma,\rho)$  [179, Eqn. (1)])<sup>14</sup>; when any D as well as only a symmetric D satisfying triangle inequality are called a 'distance'. Mathematically, our definition of «information» coincides with the definition of a «contrast functional» in [133, p. 794] and of a «distance» in [109, p. 161], with the property (I) of D in [65, p. 1019] (=[66, p. 5]), and can be seen as turning [90, Lemm. 2.1] into an axiom.
- (v) First special case of left  $D_{\Psi}$ -projection for nonsymmetric  $D_{\Psi}$ , with  $D_{\Psi}$  given by the Kullback–Leibler information (i.e.  $D_{\Psi}$  on  $\mathbb{R}^n \times \mathbb{R}^n$  with  $\Psi(x_i) = \sum_{i=1}^n (x_i \log(x_i) x_i)$ ), was independently introduced in [306, p. 32] and [209, Ch. 3.2]. First special case of right  $D_{\Psi}$ -projection for nonsymmetric  $D_{\Psi}$ , with  $D_{\Psi}$  given by the Kullback–Leibler information, was introduced in [97, Eqn. (16)] (cf. also [98, Def. 22.2]). First instance of a right pythagorean (in)equality (56), together with its interpretation as «nonsymmetrical analogue of the theorem of Pythagoras», was established in [97, Thm. 1] for the Kullback–Leibler information. The corresponding special case of (54) was first considered implicitly in [65, p. 1021] and explicitly in [106, Thm. 2.2].

#### 2.2.2 Quasinonexpansive maps

**Definition 2.12.** For any  $(X, \|\cdot\|_X)$ , let  $\emptyset \neq K \subseteq X$ ,  $T: K \to X$ . Then:

- (i)  $x \in K$  is called a **fixed point** of T iff T(x) = x; a set of all fixed points of T will be denoted Fix(T);
- (ii)  $x \in \operatorname{cl}(K)$  is called an **asymptotic fixed point** of T iff there exists  $\{x_n \in K : n \in \mathbb{N}\}$  which converges weakly to x, and  $\lim_{n\to\infty} \|x_n T(x_n)\|_X = 0$  [289, p. 313]. The set of all asymptotic fixed points of T will be denoted  $\widehat{\operatorname{Fix}}(T)$ .

**Definition 2.13.** Let  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi)), \ \Psi \in \Gamma^{\operatorname{G}}(X, \|\cdot\|_X), \ T: K \to \operatorname{int}(\operatorname{efd}(\Psi)) \ will \ be \ called:$ 

(i) completely nonexpansive with respect to  $\Psi$  and K iff [84, 2.1.7]

$$D_{\Psi}(T(x), T(y)) \le D_{\Psi}(x, y) \ \forall x, y \in K; \tag{59}$$

(ii) left strongly quasinonexpansive with respect to  $\Psi$  and K, iff [92, Def. 3.2] [289, pp. 313–314]  $\varnothing \neq \widehat{\operatorname{Fix}}(T) \subseteq \operatorname{efd}(\Psi)$ ,

$$D_{\Psi}(y, T(x)) \le D_{\Psi}(y, x) \ \forall (y, x) \in \widehat{\text{Fix}}(T) \times K,$$
 (60)

and, for any  $y \in \widehat{Fix}(T)$  and any bounded  $\{x_n \in K : n \in \mathbb{N}\},\$ 

$$\lim_{n \to \infty} (D_{\Psi}(y, x_n) - D_{\Psi}(y, T(x_n))) = 0 \quad \Rightarrow \quad \lim_{n \to \infty} D_{\Psi}(T(x_n), x_n) = 0. \tag{61}$$

<sup>&</sup>lt;sup>14</sup>Furthermore, the notion of «divergence» has already other meanings in differential calculus and in renormalisation.

(iii) right strongly quasinonexpansive with respect to  $\Psi$  and K iff [240, Def. 2.3.(iv)]  $\varnothing \neq \widehat{\text{Fix}}(T) \subseteq \text{int}(\text{efd}(\Psi)),$ 

$$D_{\Psi}(T(x), y) \le D_{\Psi}(x, y) \ \forall (x, y) \in K \times \widehat{\text{Fix}}(T),$$
 (62)

and, for any  $y \in \widehat{Fix}(T)$  and any bounded  $\{x_n \in K : n \in \mathbb{N}\},\$ 

$$\lim_{n \to \infty} (D_{\Psi}(x_n, y) - D_{\Psi}(T(x_n), y)) = 0 \quad \Rightarrow \quad \lim_{n \to \infty} D_{\Psi}(x_n, T(x_n)) = 0; \tag{63}$$

(iv) left firmly nonexpansive with respect to  $\Psi$  and K iff [69, Def. 3] [41, Def. 3.4, Prop. 3.5.(iv)]  $\forall x, y \in K$ 

$$D_{\Psi}(T(x), T(y)) + D_{\Psi}(T(y), T(x)) + D_{\Psi}(T(x), x) + D_{\Psi}(T(y), y) \le D_{\Psi}(T(x), y) + D_{\Psi}(T(y), x);$$
(64)

(v) right firmly nonexpansive with respect to  $\Psi$  and K iff [240, Def. 2.3.(i\*)]  $\forall x, y \in K$ 

$$D_{\Psi}(T(x), T(y)) + D_{\Psi}(T(y), T(x)) + D_{\Psi}(x, T(x)) + D_{\Psi}(y, T(x)) \le D_{\Psi}(x, T(y)) + D_{\Psi}(y, T(x)).$$
(65)

The set of all left (resp., right) strongly quasinonexpansive maps with respect to  $\Psi$  and K will be denoted LSQ( $\Psi$ , K) (resp., RSQ( $\Psi$ , K)). The set of all left (resp., right) firmly nonexpansive maps with respect to  $\Psi$  and K will be denoted LFN( $\Psi$ , K) (resp., RFN( $\Psi$ , K)). The set of all completely nonexpansive maps with respect to  $\Psi$  and K will be denoted CN( $\Psi$ , K).

**Definition 2.14.** If  $(X, \|\cdot\|_X)$  is reflexive, then  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$  will be called **LSQ-compositional** (resp., **RSQ-compositional**) on  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  iff, for any set  $\{T_i : K \to K : T_i \in \operatorname{LSQ}(\Psi, K) \ (resp., \operatorname{RSQ}(\Psi, K)), \ i \in \{1, \dots, m\}, m \in \mathbb{N}\}$  such that  $\hat{F} := \bigcap_{i=1}^m \widehat{\operatorname{Fix}}(T_i) \neq \varnothing$ ,

- (i)  $\widehat{\operatorname{Fix}}(T_m \circ \cdots \circ T_1) \subseteq \hat{F};$
- (ii) if  $\widehat{\operatorname{Fix}}(T_m \circ \cdots \circ T_1) \neq \emptyset$ , then  $T_m \circ \cdots \circ T_1 \in \operatorname{LSQ}(\Psi, K)$  (resp.,  $\operatorname{RSQ}(\Psi, K)$ ).

The set LSQ( $\Psi$ , K) (resp., RSQ( $\Psi$ , K)) will be called **composable** iff  $\Psi$  is LSQ-(resp., RSQ-)compositional on K.  $\Psi$  will be called **LSQ-compositional** (resp., **RSQ-compositional**) iff it is LSQ-(resp., RSQ-)compositional on any  $K \subseteq \text{int}(\text{efd}(\Psi))$ .

**Definition 2.15.** If  $(X, \|\cdot\|_X)$  is reflexive, then  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$  will be called:

- a) **LSQ-adapted** on a set  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  iff  $T \in \operatorname{LFN}(\Psi, K) \Rightarrow (T \in \operatorname{LSQ}(\Psi, K), \operatorname{Fix}(T) = \operatorname{Fix}(T)$ , and  $\operatorname{Fix}(T)$  is convex and closed);
- b) **RSQ-adapted** on a set  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  iff  $T \in \operatorname{RFN}(\Psi, K) \Rightarrow (T \in \operatorname{RSQ}(\Psi, K), \widehat{\operatorname{Fix}}(T) = \operatorname{Fix}(T), \text{ and } \mathfrak{D}^{\operatorname{G}}\Psi(\operatorname{Fix}(T)) \text{ is convex and closed}).$

**Proposition 2.16.** If  $(X, \|\cdot\|_X)$  is reflexive and  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ , then:

- (i)  $\Psi$  is LSQ-compositional if any of (generally, inequivalent) conditions holds:
  - a)  $\Psi: X \to \mathbb{R}$  is uniformly convex on X,  $\mathfrak{D}^G \Psi$  is (bounded and uniformly continuous) on bounded subsets of X [289, Lemm. 1, 2]; or
  - b)  $\Psi: X \to \mathbb{R}$  is (bounded, uniformly Fréchet differentiable, totally convex) on bounded subsets of X,  $\mathfrak{D}^{G}(\Psi^{\mathbf{F}})$  is bounded on bounded subsets of  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^{\star}$  [241, Prop. 3.3];
- (ii)  $\Psi$  is RSQ-compositional if any of (generally, inequivalent) conditions holds:
  - a)  $\Psi: X \to \mathbb{R}$  is (bounded, uniformly Fréchet differentiable, totally convex) on bounded subsets of X [241, Prop. 4.4]; or
  - b) efd( $\Psi^{\mathbf{F}}$ ) =  $X^*$ ,  $\Psi$  is Euler–Legendre,  $\Psi^{\mathbf{F}}$  is totally convex on bounded subsets of  $X^*$ ,  $\mathfrak{D}^{\mathbf{G}}\Psi$  is (bounded and uniformly continuous) on bounded subsets of int(efd( $\Psi$ )),  $\mathfrak{D}^{\mathbf{G}}\Psi^{\mathbf{F}}$  is (bounded and uniformly continuous) on bounded subsets of  $X^*$  [241, Prop. 6.6];
- (iii)  $\Psi: X \to \mathbb{R}$  is LSQ-adapted on any convex closed  $\emptyset \neq K \subseteq X$  if  $\Psi$  is Euler-Legendre and (bounded and uniformly Fréchet differentiable) on bounded subsets of X [291, Lemm. 15.5, Lemm. 15.6]+[305, Rem. 2.1.3];
- (iv)  $\Psi$  is RSQ-adapted on any  $\emptyset \neq K \subseteq X$  if  $\Psi : X \to \mathbb{R}$  is Euler-Legendre, and any of (generally, inequivalent) conditions holds:

- a)  $\Psi$  is uniformly continuous on bounded subsets of X,  $\mathfrak{D}^{G}\Psi$  is weakly sequentially continuous<sup>15</sup> [240, Prop. 3.3, Prop. 3.6]; or
- b)  $\Psi^{\mathbf{F}}$  is (uniformly Fréchet differentiable and bounded) on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) \neq \emptyset$ ,  $\mathfrak{D}^{\mathbf{G}}\Psi$  is uniformly continuous on bounded subsets of X [240, Prop. 3.3, Rem. 3.7].
- (v) if  $\Psi$  is Euler-Legendre,  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ,  $T: K \to \operatorname{int}(\operatorname{efd}(\Psi))$ ,  $\mathfrak{D}^{G}\Psi$  and  $\mathfrak{D}^{G}\Psi^{F}$  are (uniformly continuous and bounded) on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi))$  and  $\operatorname{int}(\operatorname{efd}(\Psi^{F})) \neq \varnothing$ , respectively, then  $T \in \operatorname{RSQ}(\Psi, K)$  iff  $\mathfrak{D}^{G}\Psi \circ T \circ \mathfrak{D}^{G}\Psi^{F} \in \operatorname{LSQ}(\Psi, \mathfrak{D}^{G}\Psi(K))$  [241, Fact 6.5].

**Definition 2.17.** Let  $(X, \|\cdot\|_X)$  be a Banach space,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\lambda \in ]0, \infty[$ .

(i) If  $T: X \to 2^{X^*}$  and graph $(T) \neq \emptyset$ , then the **left** (resp., **right**)  $D_{\Psi}$ -resolvent of  $\lambda T$  is defined as [131, Lemm. 1] [41, Def. 3.7] (resp., [240, Def. 5.3])

$$\stackrel{\longleftarrow}{\operatorname{res}}_{\lambda T}^{\Psi} := (\mathfrak{D}^{G}\Psi + \lambda T) \circ \mathfrak{D}^{G}\Psi : X \to 2^{X}$$
(66)

$$(resp., \overrightarrow{res}_{\lambda T}^{\Psi} := (\operatorname{id}_{X^{\star}} + \lambda T \circ \mathfrak{D}^{G} \Psi^{\mathbf{F}})^{-1} : X^{\star} \to 2^{X^{\star}}).$$
 (67)

(ii) If  $f: X \to ]-\infty, \infty]$  is proper, then the **left** (resp., **right**)  $D_{\Psi}$ -**proximal map** of index  $\lambda$  is defined as [93, Eqn. (13)] [41, Def. 3.16] (resp., [43, Def. 3.7] [213, Def. 3.3])

$$\overline{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}: X \ni y \mapsto \underset{x \in \operatorname{efd}(f) \cap \operatorname{efd}(\Psi)}{\operatorname{arg inf}} \{f(x) + \lambda D_{\Psi}(x,y)\} \in 2^{X}$$
(68)

$$(resp., \overrightarrow{prox}_{\lambda,f}^{D_{\Psi}}: X \ni y \mapsto \underset{x \in \text{efd}(f) \cap \text{int}(\text{efd}(\Psi))}{\arg \inf} \{f(x) + \lambda D_{\Psi}(y, x)\} \in 2^{X}), \tag{69}$$

whenever the argument of  $\inf\{\ldots\}$  is finite.

**Proposition 2.18.** Let  $(X, \|\cdot\|_X)$  be reflexive and let  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$  be Euler-Legendre. Then:

(i) if  $T: X \to 2^{X^*}$ , then

$$\overrightarrow{\operatorname{res}}_{T}^{\Psi} = \mathfrak{D}^{G} \Psi \circ \overleftarrow{\operatorname{res}}_{T}^{\Psi} \circ \mathfrak{D}^{G} \Psi^{\mathbf{F}}$$

$$\tag{70}$$

with  $\operatorname{efd}(\overrightarrow{\operatorname{res}}_T^{\Psi}) = \mathfrak{D}^{\operatorname{G}}\Psi(\operatorname{efd}(\overleftarrow{\operatorname{res}}_T^{\Psi}))$  and  $\operatorname{ran}(\overrightarrow{\operatorname{res}}_T^{\Psi}) = \mathfrak{D}^{\operatorname{G}}\Psi(\operatorname{ran}(\overleftarrow{\operatorname{res}}_T^{\Psi}))$  [240, Lemm. 5.4];

(ii) if  $f: X \to ]-\infty, \infty]$  is proper and satisfies  $\operatorname{efd}(f) \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$ , then [213, Lemm. 3.4]

$$\overrightarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}(x) = \mathfrak{D}^{G}\Psi^{\mathbf{F}} \circ \overleftarrow{\operatorname{prox}}_{\lambda,f \circ \mathfrak{D}^{G}\Psi^{\mathbf{F}}}^{D_{\Psi}\mathbf{F}} \circ \mathfrak{D}^{G}\Psi(x) \quad \forall x \in \operatorname{int}(\operatorname{efd}(\Psi)). \tag{71}$$

**Proposition 2.19.** Let  $(X, \|\cdot\|_X)$  be a Banach space, let  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ , and let  $\varnothing \neq K \subseteq X$  be such that  $K \cap \mathrm{efd}(\Psi) \neq \varnothing$  and  $(K \cap \mathrm{efd}(\Psi) \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  or  $K \cap \mathrm{efd}(\partial \Psi) \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  or  $K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  or  $K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  or  $K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  or  $K \not= \emptyset$  and  $K \cap \mathrm{efd}(\Psi)$  is open or  $(\mathrm{int}(\mathrm{efd}(\Psi)) \cap K \neq \varnothing)$  and  $K \cap \mathrm{efd}(\Psi)$  is essentially Gateaux differentiable).

- (i) If  $\lambda \in ]0, \infty[$ ,  $f \in \Gamma(X, \|\cdot\|_X)$ , and K = efd(f), then  $\overleftarrow{\text{prox}}_{\lambda, f}^{D_{\Psi}} = \overleftarrow{\text{res}}_{\lambda \partial f}^{\Psi}$  [41, Prop. 3.22.(ii).(a), Prop. 3.23].
- (ii) If K is closed and convex, and  $K \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \varnothing$ , then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}} = \overleftarrow{\operatorname{prox}}_{1,\iota_{K}}^{D_{\Psi}} = \overleftarrow{\operatorname{res}}_{\partial\iota_{K}}^{\Psi}$  with  $\operatorname{Fix}(\overleftarrow{\operatorname{res}}_{\partial\iota_{K}}^{\Psi}) = K \cap \operatorname{int}(\operatorname{efd}(\Psi))$  [41, Prop. 3.32, Prop. 3.33].

**Proposition 2.20.** Let  $(X, \|\cdot\|_X)$  be a Banach space, let  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ , and let  $T: X \to 2^{X^*}$  be monotone. Then:

- (i)  $\overleftarrow{\operatorname{res}}_T^{\Psi} \in \operatorname{LFN}(\Psi, X)$  with  $\operatorname{efd}(\overleftarrow{\operatorname{res}}_T^{\Psi}) \subseteq \operatorname{int}(\operatorname{efd}(\Psi)) \supseteq \operatorname{ran}(\overleftarrow{\operatorname{res}}_T^{\Psi})$  and  $\operatorname{Fix}(\overleftarrow{\operatorname{res}}_T^{\Psi}) = \operatorname{int}(\operatorname{efd}(\Psi)) \cap T^{-1}(0)$ [41, Prop. 3.8.(i)–(iii),(iv).(a)];
- (ii) if  $\operatorname{ran}(\mathfrak{D}^{G}\Psi) \subseteq \operatorname{ran}(\mathfrak{D}^{G}\Psi+T)$  and  $\Psi$  is strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$ , then [41, Prop. 3.8.(iv).(b)–(c)]  $\operatorname{\acute{res}}_{T}^{\Psi}$  is single-valued on  $\operatorname{efd}(\operatorname{\acute{res}}_{T}^{\Psi})$ ,  $\operatorname{Fix}(\operatorname{\acute{res}}_{T}^{\Psi})$  is convex, and [131, Lemm. 1] [41, Prop. 3.3.(i)]

$$D_{\Psi}(y, \overleftarrow{\operatorname{res}}_{T}^{\Psi}(x)) + D_{\Psi}(\overleftarrow{\operatorname{res}}_{T}^{\Psi}(x), x) \leq D_{\Psi}(y, x) \ \forall (y, x) \in \operatorname{Fix}(\overleftarrow{\operatorname{res}}_{T}^{\Psi}) \times X; \tag{72}$$

(iii) if  $(X, \|\cdot\|_X)$  is reflexive,  $\lambda \in ]0, \infty[$ , T is maximally monotone with  $\operatorname{efd}(T) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ,  $\Psi$  is Euler-Legendre, and  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^*$ , then  $\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi}$  is single-valued on  $\operatorname{efd}(\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi})$ , and (72) holds for  $\overleftarrow{\operatorname{res}}_{T}^{\Psi}$  replaced by  $\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi}$  [41, Prop. 3.13.(iv).(b)];

<sup>&</sup>lt;sup>15</sup>For any Banach space  $(X, \|\cdot\|_X)$ ,  $f: X \to X^*$  is called **weakly sequentially continuous** iff a weak convergence of  $\{x_n \in X : n \in \mathbb{N}\}$  to  $x \in X$  implies a weak convergence of  $\{f(x_n) : n \in \mathbb{N}\}$  to f(x).

- $\textit{(iv)} \ \textit{if} \ (X,\|\cdot\|_X) \ \textit{is} \ \textit{reflexive}, \ f \ \in \ \Gamma(X,\|\cdot\|_X), \ \Psi \ \textit{is} \ \textit{Euler-Legendre}, \ \text{int}(\text{efd}(\Psi)) \cap \text{efd}(f) \ \neq \ \varnothing, \ \textit{and}$  $\lambda \in ]0, \infty[$ , then  $\overleftarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}$  is single-valued on  $\operatorname{efd}(\overleftarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}})$  and satisfies (72) with  $\overleftarrow{\operatorname{res}}_{T}^{\Psi}$  replaced by  $\overrightarrow{\text{prox}}_{\lambda,f}^{D_{\Psi}}$  [41, Cor. 3.25].
- (v) if  $(X, \|\cdot\|_X)$  is reflexive,  $\operatorname{int}(\operatorname{efd}(\Psi)) \cap \operatorname{efd}(T) \neq \emptyset$ ,  $\Psi$  is strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$  and  $\operatorname{Euler-Legendre}$ , then  $\operatorname{efd}(\overrightarrow{\operatorname{res}}_T^{\Psi}) \subseteq \operatorname{int}(\operatorname{efd}(\Psi)) \supseteq \operatorname{ran}(\overrightarrow{\operatorname{res}}_T^{\Psi})$ ,  $\operatorname{Fix}(\overrightarrow{\operatorname{res}}_T^{\Psi}) = \mathfrak{D}^{\operatorname{G}}\Psi(\operatorname{int}(\operatorname{efd}(\Psi)) \cap T^{-1}(0))$ ,  $\overrightarrow{\operatorname{res}}_T^{\Psi}$  is single-valued on  $\operatorname{efd}(\overrightarrow{\operatorname{res}}_T^{\Psi})$ , and  $\overrightarrow{\operatorname{res}}_T^{\Psi} \in \operatorname{RFN}(\Psi^{\mathbf{F}}, X^{\star})$  [240, Lemm. 5.4, Prop. 5.5];

Corollary 2.21. Let  $(X, \|\cdot\|_X)$  be reflexive,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ .  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ .

- (i) If  $\Psi$  is LSQ-adapted on K, then:
  - a) for any closed and convex  $C \subseteq K$ ,  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi}}: K \to \operatorname{int}(\operatorname{efd}(\Psi))$  belongs to  $\operatorname{LSQ}(\Psi, K)$ , with  $\widehat{\operatorname{Fix}}(\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi}}) = \operatorname{Fix}(\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi}}) = C$ ; b) if K = X, then for any monotone  $T: X \to 2^{X^{\star}}$ ,  $\overleftarrow{\operatorname{res}}_{T}^{\Psi} \in \operatorname{LSQ}(\Psi, X)$ .
- (ii) If  $\Psi$  is RSQ-adapted on K, then:
  - (a) if  $\mathfrak{D}^G\Psi$  is bounded on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\mathfrak{D}^G\Psi^F$  is bounded on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , then for any  $\emptyset \neq C \subseteq K$  such that  $\mathfrak{D}^G \Psi(C)$  is convex and closed,  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}}: K \to \operatorname{int}(\operatorname{efd}(\Psi)) \text{ belongs to } \operatorname{RSQ}(\Psi, K), \text{ with } \overrightarrow{\operatorname{Fix}}(\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}}) = \operatorname{Fix}(\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}}) = C;$ (b) if K = X,  $T : X \to 2^{X^{*}}$  is monotone,  $\operatorname{int}(\operatorname{efd}(\Psi)) \cap \operatorname{efd}(T) \neq \varnothing$ ,  $\Psi$  is strictly convex on
  - $\operatorname{int}(\operatorname{efd}(\Psi))$  and  $\operatorname{Euler-Legendre}$ , then  $\operatorname{\overrightarrow{res}}_T^{\Psi} \in \operatorname{RSQ}(\Psi^{\mathbf{F}}, X^{\star})$ .

(i) Follows from Propositions 2.20.(i) and 2.19.(ii).

(ii) Follows from (i), Proposition 2.10, [241, Fact 6.2], and Proposition 2.20.(v).

 $\operatorname{int}(\operatorname{efd}(\Psi))$  satisfy the conditions of Corollary 2.21.(i).a) (resp., 2.21.(ii).a)), then  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi}}(\operatorname{resp.}, \overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}})$ will be said to be adapted.

(i) In general, neither  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  nor  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  belongs to  $\mathrm{CN}(\Psi,K)$  (see [84, §2.1.7] for an Remark 2.23. example).

- (ii) The apparent difference in the range of left and right composites of Definitions 2.22 is caused by the limitations in the currently available knowledge regarding right  $D_{\Psi}$ -projections: in practice, all of known results in the reflexive Banach space setting are obtained by the Euler-Legendre transformation of the corresponding properties of left  $D_{\Psi}$ -projections. (Cf. Remarks 3.47.(i) and 3.47.(v).
- (iii) For  $\Psi = \frac{1}{2} \|\cdot\|_X^2$ ,  $\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi}$  was introduced first in [191, Eqn. (1)]. For  $(X, \|\cdot\|_X)$  given by the Hilbert space, and  $\Psi = \frac{1}{2} \|\cdot\|_X^2$ ,  $\overleftarrow{\operatorname{res}}_T^{\Psi} = (T + \operatorname{id}_X)^{-1}$  was introduced in [355, Lemm. 2] and [252, Cor. (p. 344)],  $\overrightarrow{\operatorname{prox}}_{1,f}^{D_{\Psi}} = \overrightarrow{\operatorname{prox}}_{1,f}^{D_{\Psi}} : y \mapsto \operatorname{arg\,inf}_{x \in \operatorname{efd}(f)} \left\{ f + \frac{1}{2} \|x - y\|_X^2 \right\}$  was introduced in [256, p. 2897] [260, p. 1069], while the corresponding  $\overleftarrow{\text{prox}}_{\lambda,f}^{D_{\Psi}} = \overrightarrow{\text{prox}}_{\lambda,f}^{D_{\Psi}}$  for  $\lambda \in ]0, \infty[$  appeared in [30, p. 539].
- (iv) For  $(X, \|\cdot\|_X)$  given by the Hilbert space  $(\mathcal{H}, \langle \cdot, \cdot \rangle_{\mathcal{H}})$ , and  $\Psi = \frac{1}{2} \|\cdot\|_{\mathcal{H}}^2$ , the definition of LFN $(\Psi, K)$ operators takes the form [74, Def. 6]

$$\langle x - y, T(x) - T(y) \rangle_{\mathcal{H}} \ge \|T(x) - T(y)\|_{\mathcal{H}}^2 \quad \forall x, y \in K.$$
 (73)

#### Quasigauge functions and Banach space geometry

#### Banach space geometry 2.3.1

A Banach space  $(X, \|\cdot\|_X)$  is said to satisfy the  $Radon-Riesz-Shmul'yan\ property^{16}$  [282, p. 1363] [296, p. 182] [314, Thm. 5] iff, for any  $\{x_n \in X : n \in \mathbb{N}\}$ , convergence of  $x_n$  to  $x \in X$  in weak topology

<sup>&</sup>lt;sup>16</sup>In the literature it is usually called either the *Radon-Riesz property* [218, §3], or an *H-property* [118, Def. 2 (Ch. 7), or the Kadec-Klee property [126, p. 119]. It was first considered by Radon [282, p. 1363] and Riesz [296, p. 182] for  $(L_{1/\gamma}(\mathcal{X}, \mu), \|\cdot\|_{1/\gamma}), \gamma \in ]1, \infty[$ . For the general Banach spaces it was first introduced and studied by Shmul'yan in [314, Thm. 5]. Kadec [188, p. 13] explicitly refers to this work of Shmul'yan, while Klee [199, pp. 25–27] explicitly refers to this paper of Kadec.

together with  $\lim_{n\to\infty} \|x_n\|_X = \|x\|_X$  implies  $\lim_{n\to\infty} \|x_n - x\|_X = 0$ . A Banach space  $(X, \|\cdot\|_X)$  is called: **strictly convex** [144, p. 39] [102, p. 404] [208, p. 178] iff

$$\forall x, y \in X \setminus \{0\} \|x + y\|_{X} = \|x\|_{X} + \|y\|_{X} \Rightarrow \exists \lambda > 0 \ y = \lambda x, \tag{74}$$

which is equivalent [304, Thm. 1.(1)] with

$$\forall x, y \in S(X, \|\cdot\|_X) \ x \neq y \ \Rightarrow \ \frac{1}{2} \|x + y\|_X < 1; \tag{75}$$

Gateaux differentiable [247, p. 78] iff  $\|\cdot\|_X$  is Gateaux differentiable at every  $x \in X \setminus \{0\}$  (or, equivalently, at every  $x \in S(X, \|\cdot\|_X)$ ), which is equivalent [247, 248] to each point of  $S(X, \|\cdot\|_X)$  having a unique supporting hyperplane<sup>17</sup>, i.e.

$$\forall x \in S(X, \|\cdot\|_X) \ \exists ! y(x) \in X^{\star} \ (y(x))(x) = \|y(x)\|_{X^{\star}} \|x\|_X = \|x\|_X;$$

uniformly convex [102, Def. 1] iff

$$\forall \epsilon_1 > 0 \ \exists \epsilon_2 > 0 \ \forall x, y \in S(X, \|\cdot\|_X) \ \|x - y\|_X \ge \epsilon_1 \ \Rightarrow \ \frac{1}{2} \|x + y\|_X \le 1 - \epsilon_2; \tag{76}$$

uniformly Fréchet differentiable iff any of the equivalent properties hold:

- (i) [262, Thm. 77.1]  $\forall \epsilon_1 > 0 \ \exists \epsilon_2 > 0 \ \forall x, y \in X \ (\|x\|_X = 1, \|y\|_X \le \epsilon_2) \Rightarrow \|x + y\|_X + \|x y\|_X \le 2 + \epsilon_1 \|y\|_X$ ,
- (ii) [117, p. 375]  $\forall \epsilon_1 > 0 \ \exists \epsilon_2 > 0 \ \forall x, y \in S(X, \|\cdot\|_X) \ \|x y\|_X \le \epsilon_1 \Rightarrow 1 \frac{1}{2} \|x + y\|_X \le \epsilon_2 \|x y\|_X$ ,
- (iii) [315, p. 645] the limit  $\mathfrak{D}^{G} \|h\|_{X}(x)$  exists in uniform convergence as x and h vary over  $S(X, \|\cdot\|_{X})$ ; **Fréchet differentiable** [248, p. 129] iff  $\|\cdot\|_{X}$  is Fréchet differentiable at every  $x \in X \setminus \{0\}$  (or, equivalently, at every  $x \in S(X, \|\cdot\|_{X})$ ), i.e. for any fixed  $x \in X \setminus \{0\}$  (or  $x \in S(X, \|\cdot\|_{X})$ )  $\mathfrak{D}^{G} \|h\|_{X}(x)$  exist in uniform convergence  $\forall h \in S(X, \|\cdot\|_{X})$ ; **locally uniformly convex** [230, Def. 0.2] iff

$$\forall \epsilon_1 > 0 \ \forall x \in S(X, \|\cdot\|_X) \ \exists \epsilon_2 > 0 \ \forall y \in S(X, \|\cdot\|_X) \ \|x - y\|_X \ge \epsilon_1 \ \Rightarrow \ \frac{1}{2} \|x + y\|_X \le 1 - \epsilon_2; \tag{77}$$

r-uniformly convex for  $r \in [2, \infty[$  [29, Def. 2)] [36, p. 468] iff

$$\exists \lambda > 0 \ \forall x, y \in X \ \|x + y\|_X^r + \|x - y\|_X^r \ge 2(\|x\|_X^r + \|\lambda^{-1}y\|_X^r), \tag{78}$$

or, equivalently, iff [292, Def. 4.1, Thm. 4.3]

$$\exists \lambda > 0 \ \forall x, y \in X \ \|x + y\|_{Y}^{r} + \lambda \|x - y\|_{Y}^{r} \le 2^{r-1} (\|x\|_{Y}^{r} + \|y\|_{Y}^{r}), \tag{79}$$

or, equivalently [346, Thm. 2.5] [36, Prop. 7], iff  $\exists c > 0$   $\delta(X, \|\cdot\|_X; \epsilon) \geq c\epsilon^r$ , where [102, Def. 1] [117, p. 375]

$$]0,2] \ni \epsilon \mapsto \delta(X, \|\cdot\|_X; \epsilon) := \inf \left\{ 1 - \frac{1}{2} \|x + y\|_X : x, y \in S(X, \|\cdot\|_X), \|x - y\|_X \ge \epsilon \right\} \in [0,1]; \quad (80)$$

r-uniformly Fréchet differentiable for  $r \in ]1, 2[29, Def. 1)[36, p. 468]$  iff

$$\exists \lambda > 0 \ \forall x, y \in X \ \|x + y\|_{X}^{r} + \|x - y\|_{X}^{r} \le 2(\|x\|_{X}^{r} + \|\lambda y\|_{X}^{r}), \tag{81}$$

or, equivalently [292, Thm. 2.2], iff [324, Def. 1]

$$\exists \lambda > 0 \ \forall x, y \in X \ \|x + y\|_{Y}^{r} + \lambda \|x - y\|_{Y}^{r} \ge 2^{r-1} (\|x\|_{Y}^{r} + \|y\|_{Y}^{r}), \tag{82}$$

or, equivalently [164, Thm. 2.4] [28, Lemm. 1] [36, Prop. 7], iff  $\exists c > 0$   $\rho(X, \|\cdot\|_X; \epsilon) \leq c\epsilon^r$ , where [225, p. 241]

$$[0, \infty[ \ni \epsilon \mapsto \rho(X, \|\cdot\|_X; \epsilon) := \sup \left\{ \frac{1}{2} (\|x + y\|_X + \|x - y\|_X) - 1 : x, y \in X, \|x\| = 1, \|y\|_X = \epsilon \right\}$$

$$= \sup \left\{ \frac{1}{2} (\|x + \epsilon y\|_X + \|x - \epsilon y\|_X) - 1 : x, y \in S(X, \|\cdot\|_X) \right\} \in \mathbb{R}^+.$$
 (83)

 $<sup>^{17}\</sup>text{More specifically, if }x\in X\setminus\{0\}\text{, then }\mathfrak{D}^{\mathrm{G}}\|x\|_{X}\text{ exists iff }\|x\|_{X}S(X,\|\cdot\|_{X})\text{ has a unique supporting hyperplane at }x.$ 

## 2.3.2 Quasigauge $\varphi$

A strictly increasing and continuous function  $\varphi: \mathbb{R}^+ \to \mathbb{R}^+$  such that  $\varphi(0) = 0$  and  $\lim_{t \to \infty} \varphi(t) = \infty$  [51, p. 407]<sup>18</sup> will be called a **gauge** [72, p. 348]. A nondecreasing function  $\varphi: \mathbb{R}^+ \to [0, \infty]$  satisfying  $\varphi \not\equiv 0$  and  $\exists u \in \mathbb{R}^+ \lim_{t \to +u} \varphi(t) < \infty$  [359, p. 367] will be called a **quasigauge**. For any Banach space  $(X, \|\cdot\|_X)$  and any quasigauge  $\varphi$ , a **duality map** on  $(X, \|\cdot\|_X)$  is defined by [27, Def. (p. 200)] [359, Eqn. (A.4)]

$$j_{\varphi}: X\ni x\mapsto \{y\in X^{\star} : [\![x,y]\!]_{X\times X^{\star}} = \|x\|_{X}\|y\|_{X^{\star}}, \ \lim_{t\to^{-}\|x\|_{X}}\varphi(t) \leq \|y\|_{X^{\star}} \leq \lim_{t\to^{+}\|x\|_{X}}\varphi(t)\} \subseteq X^{\star}, \ (84)$$

with the convention  $\lim_{t\to -0} \varphi(t) \equiv \varphi(0)$ . For any gauge  $\varphi$ , (84) turns into [51, p. 407]

$$j_{\varphi}: X \ni x \mapsto \{y \in X^{\star} : [\![x,y]\!]_{X \times X^{\star}} = \|x\|_{X} \|y\|_{X^{\star}}, \ \|y\|_{X^{\star}} = \varphi(\|x\|_{X})\} \subseteq X^{\star}, \tag{85}$$

which is said to be **normalised**, and denoted as j, iff  $\varphi(t) = t$  [198, p. 35] [330, p. 211]. For any quasigauge  $\varphi$ , let  $j_{\varphi}^{\star}$  denote a duality map on  $(X^{\star}, \|\cdot\|_{X^{\star}})$ . Then, for any gauge [121, Prop. 3]

$$j_{\varphi} = (j_{\varphi^{-|}}^{\star})^{-|} \circ J_X \text{ and } (j_{\varphi})^{-|} = (J_X)^{-|} \circ j_{\varphi^{-|}}^{\star}.$$
 (86)

If  $\varphi_1$  and  $\varphi_2$  are gauges, then [101, Prop. I.3.1.g)]

$$\varphi_2(\|x\|_X)j_{\varphi_1}(x) = \varphi_1(\|x\|_X)j_{\varphi_2}(x) \ \forall x \in X.$$
(87)

For any quasigauge  $\varphi$ ,

$$X \ni x \mapsto \Psi_{\varphi}(x) := \int_{0}^{\|x\|_{X}} \mathrm{d}t \, \varphi(t) \in \mathbb{R}^{+}$$
 (88)

satisfies  $\Psi_{\varphi} \in \Gamma(X, \|\cdot\|_X)$  [360, p. 281],  $\Psi_{\varphi}(0) = 0$  [359, p. 368], as well as [27, p. 200] [359, Prop. A.3.(i)]

$$j_{\omega}(x) = \partial \Psi_{\omega}(x) \ \forall x \in X \setminus \{0\} \text{ with } j_{\omega}(0) = 0.$$
 (89)

If  $\varphi$  is a gauge, then  $\Psi_{\varphi}$  is continuous (cf., e.g., [361, Thm. 3.7.2.(i)]).

## 2.3.3 Characterisation of Banach space geometry by $\Psi_{\varphi}$

**Remark 2.24.** In order to stress that the properties of  $\Psi_{\varphi}$  depend on a choice of the specific norm  $\|\cdot\|_X$  on X, while avoiding the notation " $\Psi_{\varphi,\|\cdot\|_X}$ " (in order to avoid dealing with such terms as " $\mathfrak{P}_C^{D_{\ell_{\Upsilon},\Psi_{\varphi_{\alpha,\beta},\|\cdot\|_{\Upsilon,p}}}}$ "), we will sometimes use the notation  $\Psi_{\varphi}:(X,\|\cdot\|_X)\to\mathbb{R}^+$ .

**Proposition 2.25.** Let  $(X, \|\cdot\|_X)$  be a Banach space,  $\varphi$  a gauge, and  $\Psi_{\varphi} : (X, \|\cdot\|_X) \to \mathbb{R}^+$ . Then:

- (i)  $(X, \|\cdot\|_X)$  is a Hilbert space iff j is linear [151, Prop. 2];
- (ii)  $(X, \|\cdot\|_X)$  is strictly convex
  - a) iff  $\Psi_{\varphi}$  is strictly convex [359, Prop. A.3.(iii)],
  - b) iff  $j_{\varphi}$  is strictly monotone on X [121, Thm. 1] (cf. [273, Thm. 1] for  $\varphi(t) = t$ );
- (iii)  $(X, \|\cdot\|_X)$  is Gateaux differentiable
  - a) iff  $\Psi_{\varphi}$  is Gateaux differentiable on X [359, Prop. A.3.(ii)],
  - b) iff  $j_{\varphi}$  is single-valued on X [359, Prop. A.3.(ii)] (cf. [247, Rem. 5, 8] [248, p. 130] [114, Cor. 4.8] for  $\varphi(t) = t$ );
- (iv)  $(X, \|\cdot\|_X)$  is Fréchet differentiable
  - a) iff  $\Psi_{\varphi}$  is Fréchet differentiable on X [361, Prop. 3.7.4.(ii)],
  - b) iff  $j_{\varphi}$  is single-valued and norm-to-norm continuous on X [101, Thm. II.2.9] (cf. [114, Cor. 4.12] for  $\varphi(t) = t$ );
- (v)  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable

<sup>&</sup>lt;sup>18</sup>Under a weakening of 'strictly increasing' to 'nondecreasing', the corresponding function, called a  $\varphi$ -function, is used in the Orlicz space theory since [244, p. 349]. In the context of duality map, this weakening, joined with dropping the condition  $\lim_{t\to\infty} \varphi(t) = \infty$ , has been considered in [27, Def. (p. 200)]. All of these functions are special cases of a quasigauge.

- a) iff  $\Psi_{\varphi}$  is uniformly Fréchet differentiable on bounded subsets of X [361, Thm. 3.7.4.(iii)],
- b) iff  $j_{\varphi}$  is single-valued and uniformly continuous on bounded subsets of X [101, Thm. II.2.10] (cf. [114, Cor. 4.12] for  $\varphi(t) = t$ );
- (vi)  $(X, \|\cdot\|_X)$  is uniformly convex
  - a) iff  $\Psi_{\varphi}$  is uniformly convex on bounded subsets of X [359, Thm. 4.1.(ii)],
  - b) iff  $\Psi_{\varphi}^{\mathbf{F}}$  is uniformly Fréchet differentiable on bounded subsets of  $X^{\star}$  [361, Thm. 3.7.9.(iv)],
  - c) iff  $(j_{\varphi})^{-1}$  is single-valued and uniformly continuous on bounded subsets of  $X^{\star}$  [359, Cor. 4.2],
  - d) iff j is f-uniformly monotone on  $B(X, \|\cdot\|_X)$  [281, Thm. 1] [349, Rem. 2] [347, Cor. 3.(iii)];
  - e) iff [88, Thm. 3]  $\forall t \in ]0,2]$

$$\inf\{[\![x-y,v-w]\!]_{X\times X^\star}\,:\, x,y\in S(X,\|\cdot\|_X),\; v\in j(x),\; w\in j(y),\; \|x-y\|_X\geq t\}>0; \eqno(90)$$

- (vii)  $(X, \|\cdot\|_X)$  is r-uniformly convex for  $r \in [2, \infty[$ 
  - a) iff  $\Psi_{\varphi}$  with  $\varphi(t) = rt^{r-1}$  is uniformly convex on X [347, Thm. 1],
  - b) iff  $j_{\widetilde{\varphi}}$  with  $\widetilde{\varphi}(t) = t^{r-1}$  is f-uniformly monotone on X with  $f(t) = \widetilde{\varphi}(t)$  [347, Cor. 1.(ii)]. In particular,  $(X, \|\cdot\|_X)$  is 2-uniformly convex
    - d) iff j is strongly monotone on X [349, p. 203] (cf. [279, Prop. 2.11]);
    - e) iff  $j^*$  is single-valued and Lipschitz continuous on  $X^*$  [357, Thm. (p. 62)];
- (viii)  $(X, \|\cdot\|_X)$  is r-uniformly Fréchet differentiable for  $r \in ]1, 2]$ 
  - a) iff  $\Psi_{\varphi}$  with  $\varphi(t) = rt^{r-1}$  is uniformly Fréchet differentiable on X [312, Thm. 10] (= [313, Thm. 6.4]) [56, Thm. 2.2],
  - b) iff  $j_{\varphi}$  with  $\varphi(t) = rt^{r-1}$  is single-valued and (r-1)-Lipschitz-Hölder continuous on X [56, Thm. 2.2],
  - c) iff  $j_{\tilde{\varphi}}$  with  $\tilde{\varphi}(t) = t^{r-1}$  is single-valued and (r-1)-Lipschitz-Hölder continuous on X [164, Thm. 2.4] [349, Rem. 5],
  - d) iff, for  $\widetilde{\varphi}(t) = t^{r-1}$ , [347, Cor. 1']

$$\exists c > 0 \ \forall x, y \in X \ \forall v \in j_{\widetilde{\varphi}}(x) \ \forall w \in j_{\widetilde{\varphi}}(y) \quad [\![x - y, v - w]\!]_{X \times X^{\star}} \le c |\![x - y]\!]_{X}^{r}. \tag{91}$$

In particular,  $(X, \|\cdot\|_X)$  is 2-uniformly Fréchet differentiable

- f) iff j is single-valued and Lipschitz continuous on X [136, Lemm. 2.4.(iv)] [357, Thm. (p. 62)],
- g) iff  $j^*$  is strongly monotone on X [357, Thm. (p. 62)];
- (ix)  $(X, \|\cdot\|_X)$  is locally uniformly convex iff  $\Psi_{\varphi}$  is uniformly convex at each  $x \in X$  [359, Thm. 4.1.(i)] (cf. [26, p. 232] for  $\varphi(t) = t$ );
- (x)  $(X, \|\cdot\|_X)$  is reflexive iff  $j_{\varphi}$  is surjective (i.e.  $X^* = \bigcup_{x \in X} \operatorname{ran}(j_{\varphi}(x))$ ) [119, Thm. III.7] (cf. also [359, Prop. A.3.(iv)]);
- (xi) if  $(X, \|\cdot\|_X)$  is reflexive, then  $((X, \|\cdot\|_X)$  is strictly convex and has the Radon-Riesz-Shmul'yan property) iff  $\Psi_{\varphi}$  is totally convex) [294, Thm. 3.1, Thm. 3.3];
- (xii) if  $(X, \|\cdot\|_X)$  is locally uniformly convex, then  $\Psi_{\varphi}$  is totally convex on X [294, Thm. 3.1, Cor. 3.4];
- (xiii)  $(X, \|\cdot\|_X)$  has the Radon-Riesz-Shmul'yan property iff at least one single-valued section T of j satisfies

$$\begin{cases}
\lim_{n \to \infty} [x_n - x, T(x_n) - T(x)]_{X \times X^*} = 0 \\
\lim_{n \to \infty} |T(x_n)|_{X^*} = |T(x)|_{X^*} \Rightarrow \lim_{n \to \infty} [x, T(x_n)]_{X \times X^*} = [x, T(x)]_{X \times X^*}
\end{cases}$$
(92)

for every  $\{x_n \in X : n \in \mathbb{N}\}$  with  $x_n$  convergent to x in the weak topology [273, Prop. 1].

Corollary 2.26.  $(X, \|\cdot\|_X)$  is r-uniformly convex for  $r \in [2, \infty[$  iff  $j_{\varphi_{\lambda}}$  is f-uniformly monotone with  $f(t) = \varphi_{\lambda}(t)$ , where  $\varphi_{\lambda}(t) = \lambda t^{r-1}$  and  $\lambda \in ]0, \infty[$ .

*Proof.* Follows from Proposition 2.25.(vii), together with (87) giving  $j_{\varphi_{\lambda}} = \lambda j_{\widetilde{\varphi}}$ , and cancellation of  $\frac{1}{\lambda}$  on both sides of (38).

Corollary 2.27. For any gauge  $\varphi$  and any Banach space  $(X, \|\cdot\|_X)$ 

(i)  $j_{\varphi}$  is a bijection iff  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, and Gateaux differentiable [101, Cor. b) (p. 105)];

(ii)  $j_{\varphi}$  is a norm-to-norm homeomorphism iff  $(X, \|\cdot\|_X)$  reflexive, strictly convex, Fréchet differentiable, and has the Radon-Riesz-Shmul'yan property [201, Lemm. 2.(i)] (and, for  $\varphi(t) = t$ , [149, Cor. (p. 189)]).

Proof. By Propositions 2.25.(iii) and 2.25.(x),  $(X, \|\cdot\|_X)$  is Gateaux differentiable and reflexive iff  $j_{\varphi}$  is single-valued and surjective. By reflexivity of  $(X, \|\cdot\|_X)$ , strict convexity of  $(X, \|\cdot\|_X)$  is equivalent with Gateaux differentiability of  $(X^*, \|\cdot\|_{X^*})$ , which is equivalent with single-valuedness and surjectivity of  $j_{\varphi^{-1}}^*$ . By reflexivity of  $(X, \|\cdot\|_X)$  and Equation (86),  $j_{\varphi} = (j_{\varphi^{-1}}^*)^{-1}$ . Hence,  $j_{\varphi}$  is a bijection. Norm-to-norm homeomorphy of  $j_{\varphi}$  follows the same way, by Proposition 2.25.(iv), and the fact [21, Thm. 3.9] that, if  $(X, \|\cdot\|_X)$  is reflexive, then  $(X^*, \|\cdot\|_{X^*})$  is Fréchet differentiable iff  $((X, \|\cdot\|_X))$  is strictly convex and has the Radon-Riesz-Shmul'yan property).

**Proposition 2.28.** For any quasigauge  $\varphi$  and any Banach space  $(X, \|\cdot\|_X)$ 

- (i)  $((X, \|\cdot\|_X))$  is Gateaux differentiable and  $\varphi$  is continuous on  $[0, \sup(\operatorname{efd}(\varphi))]$  iff  $j_{\varphi}$  is single-valued on  $\inf(\operatorname{efd}(\Psi_{\varphi})) = \inf(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X))$  [359, Prop. A.3.(ii)];
- (ii)  $((X, \|\cdot\|_X)$  is strictly convex and  $\varphi$  is strictly increasing on  $\operatorname{efd}(\varphi)$ ) iff  $\Psi_{\varphi}$  is strictly convex on  $\operatorname{efd}(\Psi_{\varphi})$  [359, Prop. A.3.(iii)] [360, Thm. 2.1.(viii)];
- (iii)  $((X, \|\cdot\|_X)$  is locally uniformly convex and  $\varphi$  is strictly increasing on  $\operatorname{efd}(\varphi)$ ) iff  $\Psi_{\varphi}$  is uniformly convex at any  $x \in \operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = \operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X))$  [359, Thm. 4.1.(i)];
- (iv)  $((X, \|\cdot\|_X)$  is uniformly convex and  $\varphi$  is strictly increasing on  $\operatorname{efd}(\varphi)$ ) iff  $\Psi_{\varphi}$  is uniformly convex on  $\lambda S(X, \|\cdot\|_X) \ \forall \lambda \in ]0, \sup(\operatorname{efd}(\varphi))]$  [359, Thm. 4.1.(ii)];
- (v)  $((X, \|\cdot\|_X)$  is reflexive and  $\lim_{t\to\infty} \varphi(t) = \infty$ ) iff  $j_{\varphi}$  is surjective [359, Prop. A.3.(iv)].

## 3 Extended Vaınberg-Brègman geometry and operators

# 3.1 $D_{\Psi}$ with $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$ and reflexive $(X, \|\cdot\|_{X})$

**Proposition 3.1.** Let  $(X, \|\cdot\|_X)$  be reflexive,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\Psi^{\mathbf{F}}$  Gateaux differentiable on  $\varnothing \neq \mathfrak{D}^{\mathrm{G}}\Psi(\mathrm{int}(\mathrm{efd}(\Psi))) \subseteq \mathrm{int}(\mathrm{efd}(\Psi^{\mathbf{F}}))$ ,  $\varnothing \neq K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$ ,  $\mathfrak{D}^{\mathrm{G}}\Psi(K)$  closed and convex. If any of the following (generally, inequivalent) conditions holds:

- a)  $\Psi^{\mathbf{F}}$  is totally convex on  $\operatorname{efd}(\Psi^{\mathbf{F}})$ ; or
- b)  $\Psi^{\mathbf{F}}$  is strictly convex on efd( $\Psi^{\mathbf{F}}$ ) and supercoercive; or
- c)  $\Psi^{\mathbf{F}}$  is Euler–Legendre,

then

- (i) K is right  $D_{\Psi}$ -Chebyshëv, and  $D_{\Psi}$  is right pythagorean on K;
- (ii)  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  is zone consistent;
- (iii)  $D_{\Psi^{\mathbf{F}}}$  is an information on  $X^*$  (and, in the case c),  $D_{\Psi}$  is an information on X);
- (iv) if  $\mathfrak{D}^{G}\Psi(K)$  is affine, then

$$D_{\Psi}(x,y) = D_{\Psi}(x, \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x)) + D_{\Psi}(\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x), y) \quad \forall (x,y) \in \operatorname{int}(\operatorname{efd}(\Psi)) \times K. \tag{93}$$

- Proof. (i) Proposition 2.8.(i), by application of Equation (58), implies that K is right  $D_{\Psi}$ -Chebyshëv. As for  $D_{\Psi}$  being right pythagorean, the proof is exactly the same as a proof of [240, Prop. 4.11], with the following changes, extending the range of its validity: (1) an extension from  $\Psi: X \to \mathbb{R}$  to  $\Psi: X \to ]-\infty, \infty]$  is provided by using Equation (58) instead of [47, Prop. 7.1, Eqn. (79)] (=[240, Eqn. (28)]), together with imposing the condition  $\mathfrak{D}^{G}\Psi(\text{int}(\text{efd}(\Psi))) \subseteq \text{int}(\text{efd}(\Psi^{F}))$ , instead of  $\text{efd}(\Psi) = X$ , as in [240, Prop. 4.11], or instead of the Euler-Legendre property of  $\Psi$ , as in [47, Prop. 7.1]; (2) the assumption of total convexity of  $\Psi^{F}$  on  $\text{efd}(\Psi^{F})$  is weakened by allowing the alternative assumptions of the Euler-Legendre property or of (strict convexity on  $\text{int}(\text{efd}(\Psi^{F}))$ ) and supercoercivity) due to Proposition 2.8.(i).
  - (i') Alternatively, one may use [235, Thm. 3.12] (relaxing its condition  $\mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) = \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$  to one-sided inclusion from left to right, because we do not require characterisation of convexity of  $\mathfrak{D}^{G}\Psi(K)$ ) and fulfill its condition of right  $D_{\Psi}$ -proximinality by Proposition 2.8.(i) to obtain equivalence of Definition 2.7.b)(i) and 2.7.b)(ii). Equation (58) gives equivalence of Equations (53) and (54).

- (ii) Follows from the assumption  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ .
- (iii) Follows directly from assumptions on  $\Psi^{\mathbf{F}}$  and Corollary 2.9.
- (iv) Follows from Equation (56) in the same way as Equation (57) follows from Equation (54).

Corollary 3.2. Let  $(X, \|\cdot\|_X)$  be reflexive,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\Psi^{\mathbf{F}}$  Gateaux differentiable on  $\varnothing \neq \mathfrak{D}^{\mathrm{G}}\Psi(\mathrm{int}(\mathrm{efd}(\Psi))) \subseteq \mathrm{int}(\mathrm{efd}(\Psi^{\mathbf{F}}))$ . If  $\varnothing \neq K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$  is convex,  $\mathfrak{D}^{\mathrm{G}}\Psi$ -convex, closed,  $\mathfrak{D}^{\mathrm{G}}\Psi$ closed, and any of the following (generally, inequivalent) conditions holds, then  $D_{\Psi}$  is left and right  $pythagorean \ on \ K:$ 

- a)  $\Psi$  is totally convex on efd( $\Psi$ ),  $\Psi^{\mathbf{F}}$  is strictly convex on efd( $\Psi^{\mathbf{F}}$ ) and supercoercive; or
- b)  $\Psi$  is strictly convex on efd( $\Psi$ ) and supercoercive,  $\Psi^{\mathbf{F}}$  is totally convex on efd( $\Psi^{\mathbf{F}}$ ); or
- c)  $\Psi$  is strictly convex on efd( $\Psi$ ) and supercoercive,  $\Psi^{\mathbf{F}}$  is strictly convex on efd( $\Psi^{\mathbf{F}}$ ) and supercoercive; or
- d)  $\Psi$  is Euler-Legendre.

Furthermore, if  $\Psi$  is Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi))$ , then an assumption of  $\mathfrak{D}^G\Psi$ -closure of C is obsolete.

*Proof.* Follows directly from Propositions 2.8 and 3.1. The case of  $(\Psi \text{ totally convex on efd}(\Psi))$  and  $\Psi^{\mathbf{F}}$  totally convex on efd( $\Psi^{\mathbf{F}}$ )) reduces to d), because, for reflexive  $(X, \|\cdot\|_X)$ , total convexity of  $\Psi$  on  $efd(\Psi)$  implies its essential strict convexity [294, Prop. 2.1] [87, Prop. 2.13] (the converse is not true [294, p. 3]). For norm-to-norm continuity of  $\mathfrak{D}^{F}\Psi$  on int(efd( $\Psi$ )) see, e.g., [361, Cor. 3.3.6].

**Proposition 3.3.** Let  $(X, \|\cdot\|_X)$  be reflexive,  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$  be Fréchet differentiable on  $int(efd(\Psi))$ . Then:

- (i) if K is convex and closed,  $\Psi$  is totally convex on efd( $\Psi$ ) and supercoercive, then  $\mathfrak{F}_K^{D_{\Psi}}$  is normto-norm continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$ , while  $\inf_{y\in K}\{D_{\Psi}(y,\,\cdot)\}\$ is continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$ ;
- (ii) if K is convex and closed,  $\Psi$  is totally convex on bounded subsets of X, supercoercive, and Euler-
- Legendre, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  is norm-to-norm continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$ ; (iii) if  $\mathfrak{D}^{G}\Psi(K)$  is convex and closed,  $\varnothing \neq \mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ ,  $\Psi^{\mathbf{F}}$  is totally convex on  $\operatorname{efd}(\Psi^{\mathbf{F}})$ , Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , and supercoercive, then  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  is norm-to-norm continuous on  $int(efd(\Psi))$ ;
- (iv) if  $\mathfrak{D}^{G}\Psi(K)$  is convex and closed,  $\Psi^{\mathbf{F}}$  is totally convex on bounded subsets of  $X^{\star}$ , Euler-Legendre, Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , and supercoercive, then  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}$  is norm-to-norm continuous on int(efd( $\Psi$ )).
- (i) By [294, Prop. 4.2, 4.3], if  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is totally convex on efd( $\Psi$ ) and Fréchet differ-Proof. entiable on  $\operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$ , and if the set  $\{y \in K : D_{\Psi}(x,y) \leq \lambda\}$  is bounded  $\forall \lambda \in ]0, \infty[$  (or, equivalently, by Corollary 2.9,  $\forall \lambda \in [0, \infty[) \ \forall y \in K$ , then  $x \mapsto \inf_{y \in K} \{D_{\Psi}(y, x)\}$  is continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$  and  $\overleftarrow{\mathfrak{P}}_K^{D_{\Psi}}:\operatorname{int}(\operatorname{efd}(\Psi))\to K$  is norm-to-norm continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$ . By [40, Lemm. 7.3.(vii)], if  $\Psi\in\Gamma(X,\|\cdot\|_X)$  is supercoercive, and  $x\in\operatorname{int}(\operatorname{efd}(\Psi))\neq\varnothing$ , then  $D_{\Psi}^+(x,\cdot)$ is coercive, which is equivalent (cf. [38, Def. 2.10, Def. 4.1.(B3).(ii)]) with boundedness of  $\{y \in \operatorname{int}(\operatorname{efd}(\Psi)) : D_{\Psi}^+(x,y) \leq \lambda\} \ \forall \lambda \in [0,\infty[ \ \forall x \in \operatorname{int}(\operatorname{efd}(\Psi)).$ 
  - (0) We will use the following fact: the Fréchet differentiability of  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$  on  $\operatorname{int}(\operatorname{efd}(\Psi))$  (resp.,  $\Psi^{\mathbf{F}} \in \Gamma^{G}(X^{\star}, \|\cdot\|_{X^{\star}})$  on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ ) is equivalent with norm-to-norm continuity of  $\mathfrak{D}^{G}\Psi = \mathfrak{D}^{F}\Psi$  (resp.,  $\mathfrak{D}^{G}\Psi^{F} = \mathfrak{D}^{F}\Psi^{F}$ ) [275, Prop. 2.8] [361, Cor. 3.3.6].
  - (ii) By [354, Thm. 3.4.(ii)], if  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$  is totally convex on bounded subsets of X, supercoercive, and Euler-Legendre, and  $\emptyset \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  is convex and closed, then the map [271, Def. 1]

$$\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) \ni y \mapsto \underset{x \in K}{\operatorname{arg inf}} \left\{ D_{\Psi}(x, \mathfrak{D}^{G} \Psi^{\mathbf{F}}(y)) \right\} \in K \tag{94}$$

is norm-to-norm continuous. Setting  $y = \mathfrak{D}^{G}\Psi(z)$  for  $z \in \operatorname{int}(\operatorname{efd}(\Psi))$ , and using Fréchet differentiability of  $\Psi$  on int(efd( $\Psi$ )) together with (0), gives a result, since a composition of norm-to-norm continuous functions is norm-to-norm continuous.

(iii) Follows from (i) and an application of Equation (58), taking into account (0), so Equation (58) is a composition of norm-to-norm continuous functions.

(iv) Follows from (ii) in the same way as (iii) follows from (i).

**Proposition 3.4.** If  $(X, \|\cdot\|_X)$  is reflexive,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ ,  $\Psi^{\mathbf{F}}$  is supercoercive,  $\Psi$  is uniformly Fréchet differentiable on bounded subsets of X, then  $\operatorname{int}(\operatorname{efd}(\Psi)) = \operatorname{efd}(\Psi) = X$ , and:

- (i)  $\Psi$  is LSQ-compositional if any of (generally, inequivalent) conditions holds:
  - a)  $\Psi$  is totally convex on X; or
  - b)  $\Psi$  is totally convex on bounded subsets of X and is supercoercive;
- (ii)  $\Psi$  is RSQ-compositional if any of (generally, inequivalent) conditions holds:
  - a)  $\Psi$  is totally convex on bounded subsets of X; or
  - b)  $\Psi$  is Euler-Legendre and supercoercive,  $\Psi^{\mathbf{F}}$  is (totally convex and uniformly Fréchet differentiable) on bounded subsets of  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^{\star}$ ;
- (iii)  $\Psi$  is LSQ-adapted on any closed and convex  $\varnothing \neq K \subseteq X$  (and  $\overleftarrow{\mathfrak{P}}_C^{D_{\Psi}}$  is adapted for any  $\varnothing \neq C \subseteq K$  with convex and closed C) if  $\Psi$  is Euler–Legendre;
- (iv)  $\Psi$  is RSQ-adapted on any  $\varnothing \neq K \subseteq X$  (and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}}$  is adapted for any  $\varnothing \neq C \subseteq K$  with convex and closed  $\mathfrak{D}^{G}\Psi(C)$ ) if  $\Psi$  is supercoercive and Euler-Legendre, and  $\Psi^{\mathbf{F}}$  is uniformly Fréchet differentiable on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) \neq \varnothing$ ;
- (v)  $(T \in RSQ(\Psi, K) \text{ iff } \mathfrak{D}^G \Psi \circ T \circ \mathfrak{D}^G \Psi^{\mathbf{F}}) \in LSQ(\Psi, \mathfrak{D}^G \Psi(K)))$  if  $\Psi$  is Euler–Legendre and super-coercive,  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ,  $T: K \to \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\Psi^{\mathbf{F}}$  is uniformly Fréchet differentiable on bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) \neq \varnothing$ .
- *Proof.* (0) For any  $\Psi \in \Gamma(X, \|\cdot\|_X)$ , by [361, Lemm. 3.6.1],  $\Psi^{\mathbf{F}}$  is supercoercive iff  $(\operatorname{efd}(\Psi) = X \text{ and } \Psi \text{ is bounded on bounded subsets}).$
- (i).a) By [361, Prop. 3.6.3] (cf. [290, Prop. 2.1]),  $\Psi$  is (bounded and uniformly Fréchet differentiable) on bounded subsets iff ( $\Psi$  is Fréchet differentiable on  $X = \text{efd}(\Psi)$  and  $\mathfrak{D}^G\Psi$  is uniformly continuous on bounded subsets). By [85, Prop. 2.3], if  $x \in \text{efd}(\Psi)$  and  $\Psi$  is Fréchet differentiable at x, then ( $\Psi$  is totally convex at x iff  $\Psi$  is uniformly convex at x). The rest follows from Proposition 2.16.(i).a), taking (0) into account.
- (i).b) Since  $\Psi^{\mathbf{F}} \in \Gamma(X, \|\cdot\|_X)$ , it is (convex and) continuous on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) = \operatorname{efd}(\Psi^{\mathbf{F}}) = X^*$  [298, Cor. 7C]. By [84, Prop. 1.1.11], if  $f: X \to \mathbb{R}$  is continuous and convex, then  $(\partial f)$  is bounded on bounded subsets of  $\operatorname{efd}(\partial f)$  iff f is bounded on bounded subsets of X). Hence, by (0), applied to  $\Psi^{\mathbf{F}}$  instead of  $\Psi$ ,  $\mathfrak{D}^{\mathbf{G}}(\Psi^{\mathbf{F}})$  is bounded on bounded subsets of  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^*$  iff  $\Psi$  is supercoercive. The rest follows from Proposition 2.16.(i).b).
- (ii)–(v) Follow, respectively, from Proposition 2.16.(ii), 2.16.(iii), 2.16.(iv).b), 2.16.(v), and Corollary 2.21, by the same technique as above.

**Proposition 3.5.** Let  $\lambda \in ]0, \infty[$ , let  $(X, \|\cdot\|_X)$  be reflexive, let  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$  be strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$ , let  $f \in \Gamma(X, \|\cdot\|_X)$  be bounded from below,  $\lim_{\|x\|_X \to \infty} f(x) = \infty$ ,  $\operatorname{efd}(f) \cap \operatorname{efd}(\Psi) \neq \emptyset$  and  $(\operatorname{efd}(f) \cap \operatorname{efd}(\Psi) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  or  $\operatorname{efd}(\Psi)$  is open or  $\operatorname{efd}(f) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  or  $(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \operatorname{efd}(f) \neq \emptyset$  and  $\Psi$  is essentially Gateaux differentiable)). Then:

- (i)  $\overleftarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}$  is single-valued and continuous on X;
- (ii) if  $\Psi$  is Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi))$  and Euler-Legendre, and  $\Psi^{\mathbf{F}}$  is Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , then  $\overrightarrow{\operatorname{prox}}_{\lambda_f}^{D_{\Psi}}$  is single-valued and continuous on  $\operatorname{int}(\operatorname{efd}(\Psi))$ .
- *Proof.* (i) Follows from [100, p. 186, Cor. 4.2], using the criteria for single-valuedness of  $\overleftarrow{\text{prox}}_{\lambda,\Psi}^{D_{\Psi}}$  provided by [41, Prop. 3.22.(ii).(d), Prop. 3.23].
  - (ii) Follows from (i), using Proposition 2.18.(ii) together with the fact (0) in the proof of Proposition 3.3.

**Proposition 3.6.** Let  $(X, \|\cdot\|_X)$  be reflexive,  $\lambda \in ]0, \infty[, r \in ]1, \infty[, s \in ]0, 1]$ , let  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\mathrm{efd}(\Psi) = X$ , and  $\Psi^{\mathbf{F}} \in \Gamma^{\mathrm{G}}(X^\star, \|\cdot\|_{X^\star})$ .

28

- (i) If  $T: X \to 2^{X^*}$  is maximally monotone,  $f \in \Gamma(X, \|\cdot\|_X)$ , and  $\mathfrak{D}^G \Psi$  is s-Lipschitz-Hölder continuous on X and g-uniformly monotone on X with  $g(t) = rt^{r-1}$ , then  $\operatorname{res}_{\lambda T}^{\Psi}$  and  $\operatorname{prox}_{\lambda, f}^{D_{\Psi}}$  are single-valued and  $\frac{s}{r-1}$ -Lipschitz-Hölder continuous on X, while  $\operatorname{res}_{\lambda T}^{\Psi}$  is single-valued and  $\frac{s^2}{(r-1)^2}$ -Lipschitz-Hölder continuous on  $X^*$ .
- (ii) If  $f: X \to ]-\infty, \infty]$  satisfies  $f \circ \mathfrak{D}^G \Psi^{\mathbf{F}} \in \Gamma(X^\star, \|\cdot\|_{X^\star})$ ,  $w \in ]0,1]$ ,  $\mathfrak{D}^G \Psi$  is w-Lipschitz-Hölder continuous on X, and  $\mathfrak{D}^G \Psi^{\mathbf{F}}$  is s-Lipschitz-Hölder continuous on  $X^\star$  and g-uniformly monotone on  $X^\star$  with  $g(t) = rt^{r-1}$ , then  $\overrightarrow{\operatorname{prox}}_{\lambda,f}^{D_\Psi}$  is single-valued and  $\frac{s^2w}{r-1}$ -Lipschitz-Hölder continuous on X.

Proof. By [286, Cor. 6.4],  $(\mathfrak{D}^{G}\Psi + \lambda T)^{-1}$  is single-valued and  $\frac{1}{r-1}$ -Lipschitz-Hölder continuous on  $X^*$ . Furthermore, we use Proposition 2.18.(i). The result for  $\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi}$  and  $\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi}$  follows from the fact that the composition of  $r_1$ -Lipschitz-Hölder map with  $r_2$ -Lipschitz-Hölder map, with both maps defined over all space, is  $r_1r_2$ -Lipschitz-Hölder map  $\forall r_1, r_2 \in ]0,1]$ . For  $\overleftarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}$  we use additionally Proposition 2.19.(i), while for  $\overrightarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi}}$  we use also Proposition 2.18.(ii).

Corollary 3.7. Let  $(X, \|\cdot\|_X)$  be reflexive,  $r \in ]1, \infty[$ ,  $s \in ]0,1]$ ,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\mathrm{efd}(X) = \mathbb{R}$ ,  $\Psi^{\mathbf{F}} \in \Gamma^{\mathrm{G}}(X^*, \|\cdot\|_{X^*})$ , and  $\varnothing \neq K \subseteq \mathrm{int}(\mathrm{efd}(\Psi))$ . Then:

- (i) if  $\mathfrak{D}^G \Psi$  is s-Lipschitz-Hölder continuous on X and g-uniformly monotone on X with  $g(t) = rt^{r-1}$ , and K is convex and closed, then  $\mathfrak{F}_K^{D_\Psi}$  is  $\frac{s}{r-1}$ -Lipschitz-Hölder continuous on X;
- (ii) if  $w \in ]0,1]$ ,  $\mathfrak{D}^G \Psi$  is w-Lipschitz-Hölder continuous on X,  $\mathfrak{D}^G \Psi^{\mathbf{F}}$  is s-Lipschitz-Hölder continuous on  $X^*$  and g-uniformly monotone on  $X^*$  with  $g(t) = rt^{r-1}$ ,  $\varnothing \neq \mathfrak{D}^G(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , and  $\mathfrak{D}^G \Psi(K) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$  is convex and closed, then  $\overline{\mathfrak{P}}_K^{D_\Psi}$  is  $\frac{s^2w}{r-1}$ -Lipschitz-Hölder continuous on X.

*Proof.* (i) Follows from Propositions 3.6.(i) and 2.19.(ii).

(ii) Follows from Propositions 3.6.(ii), 2.18.(ii), and 2.19.(ii).

**Lemma 3.8.** If  $\Psi \in \Gamma(X, \|\cdot\|_X)$ , as well as  $\operatorname{efd}(\Psi) = X$  and  $\operatorname{efd}(\Psi^{\mathbf{F}}) \neq \{*\}$  (resp.,  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^*$  and  $\operatorname{efd}(\Psi) \neq \{*\}$ ), then:

- (i)  $\Psi$  is uniformly Fréchet differentiable (resp., uniformly convex) on X iff  $\Psi^{\mathbf{F}}$  is uniformly convex (resp., uniformly Fréchet differentiable) on  $X^*$ ;
- (ii) if  $\Psi$  is uniformly Fréchet differentiable on bounded subsets (resp., uniformly convex on bounded subsets) of X, and supercoercive, then  $\Psi^{\mathbf{F}}$  is uniformly convex on bounded subsets (resp., uniformly Fréchet differentiable on bounded subsets) of  $X^*$ .

Proof. Let  $\Psi \in \Gamma(X, \|\cdot\|_X)$ . By [34, Cor. 2.8], if  $\operatorname{efd}(\Psi) \neq \{*\}$  (resp.,  $\operatorname{efd}(\Psi^{\mathbf{F}}) \neq \{*\}$ ), then  $\Psi$  is uniformly convex (resp., uniformly Gateaux differentiable) on X iff  $\Psi^{\mathbf{F}}$  is uniformly Gateaux differentiable (resp., uniformly convex) on  $X^*$ . By [361, p. 207] (cf. [312, p. 4](=[313, p. 643])),  $\Psi$  is uniformly Fréchet differentiable on any  $\emptyset \neq K \subseteq \operatorname{efd}(\Psi)$  iff  $\Psi$  is uniformly Gateaux differentiable on K. Setting  $\operatorname{efd}(\Psi) = X$  gives (i). (ii) follows directly from (i) and [361, Prop. 3.6.2.(i)].

**Proposition 3.9.** Let  $(X, \|\cdot\|_X)$  be reflexive,  $\varnothing \neq K \subseteq X$ ,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$  be supercoercive and strictly convex,  $\Psi^{\mathbf{F}} \in \Gamma^{\mathrm{G}}(X^\star, \|\cdot\|_{X^\star})$  be supercoercive and strictly convex. For any convex set  $C \subseteq X$ , let  $C^\circ := \{y \in X^\star : [x, y]_{X \times X^\star} \leq 0 \ \forall x \in C\}$ . Then:

(i) if  $\Psi: X \to \mathbb{R}$ ,  $\Psi^{\mathbf{F}}(0) = 0$ ,  $(\mathfrak{D}^{\mathbf{G}}\Psi^{\mathbf{F}})(0) = 0$ ,  $(\mathfrak{D}^{\mathbf{G}}\Psi^{\mathbf{F}})(-y) = -(\mathfrak{D}^{\mathbf{G}}\Psi^{\mathbf{F}})(y) \ \forall y \in X^*$ ,  $\varnothing \neq K \subset X$  is a closed convex cone with a vertex at  $0 \in X$ , then

$$\forall x \in X \quad \left\{ \begin{array}{l} x = (\mathfrak{D}^{G}\Psi)^{-1} \circ \hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}} \circ \mathfrak{D}^{G}\Psi(x) + \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x) \\ \left[ \left[ \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x), \hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}} \circ \mathfrak{D}^{G}\Psi(x) \right] \right]_{X \times X^{\star}} = 0, \end{array} \right.$$
(95)

where

$$\begin{cases}
\hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}}(y) := \arg\inf_{z \in K^{\circ}} \left\{ \Psi^{\mathbf{F}}(y - z) \right\} \ \forall y \in X^{\star} \\
\hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}} \circ \hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}}(y) = \hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}}(y) \ \forall y \in X^{\star};
\end{cases}$$
(96)

(ii) if  $\Psi^{\mathbf{F}}: X^{\star} \to \mathbb{R}$ ,  $\Psi(0) = 0$ ,  $(\mathfrak{D}^{\mathbf{G}}\Psi)(0) = 0$ ,  $(\mathfrak{D}^{\mathbf{G}}\Psi)(-x) = -(\mathfrak{D}^{\mathbf{G}}\Psi)(x) \ \forall x \in X, \varnothing \neq \mathfrak{D}^{\mathbf{G}}\Psi(K) \subset X^{\star}$  is a closed convex cone with a vertex at  $0 \in X^{\star}$ , then

$$\forall y \in X \quad \left\{ \begin{array}{l} y = \hat{\mathfrak{P}}_{(\mathfrak{D}^{G}\Psi(K))^{\circ}}^{\Psi}(y) + \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y) \\ \left[ \left[ (\mathfrak{D}^{G}\Psi^{\mathbf{F}})^{-|} \circ \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y), \hat{\mathfrak{P}}_{(\mathfrak{D}^{G}\Psi(K))^{\circ}}^{\Psi}(y) \right] \right]_{X \times X^{\star}} = 0, \end{array} \right.$$
(97)

Furthermore,

- (iii) if  $\varnothing \neq K \subseteq X$  is a linear subspace instead of a closed convex cone, then (95) holds under replacement of  $K^{\circ}$  with  $K^{\perp} := \{y \in X^{\star} : [\![x,y]\!]_{X \times X^{\star}} = 0 \ \forall x \in K\};$
- (iv) if  $\varnothing \neq \mathfrak{D}^{G}\Psi(K) \subseteq X^{\star}$  is a linear subspace instead of a closed convex cone, then (97) holds under replacement of  $(\mathfrak{D}^{G}\Psi(K))^{\circ}$  with  $(\mathfrak{D}^{G}\Psi(K))^{\perp}$ .

*Proof.* (i) This is [13, Thm. 3.19].

- (iii) This is [13, Rem. 3.20].
- (ii)+(iv) Follows directly from (i) and (iii) combined with Proposition 2.10.

**Remark 3.10.** (i) Proposition 3.1.(i) is a generalisation of [240, Prop. 4.11], as indicated in the proof.

- (ii) Regarding Corollary 3.2, left and right projections onto sets which are both convex and  $\mathfrak{D}^{G}\Psi$ convex (despite that  $\mathfrak{D}^{G}\Psi$  is not an affine map) were considered earlier in [45, p. 11, Probl. 3].
- (iii) Proposition 3.3.(i) provides a (new) special case of [294, Prop. 4.2, 4.3], which is more suitable for our purposes, because it allows to derive Proposition 3.3.(iii), as well as Propositions 3.23.(ii) and 3.23.(iii).  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{X})$  totally convex on efd( $\Psi$ ), such that  $D_{\Psi}(x, \cdot)$  is coercive on int(efd( $\Psi$ ))  $\forall x \in \text{efd}(\Psi)$  is called a *Brègman function* in [84, Def. 2.1.1], and it provides a Banach space generalisation (and also a weakening) of the notion of Brègman function introduced in [90, Def. 2.1] (cf. also [38, §4]). See [287, Def. 4.2] for further generalisation and discussion of this notion.
- (iv) The direct relationship between the differing assumptions of Propositions 3.3.(i) (resp., 3.3.(iii)) and 3.3.(ii) (resp., 3.3.(iv)) is not clear at this level of generality. However, in a special case of  $\Psi = \Psi_{\varphi}$ , the former variants are essentially more general than the latter, see Remark 3.33.(vi).
- (iv) Proposition 3.3.(iii) is essentially new in the Banach space setting. For  $X = \mathbb{R}^n$ ,  $\emptyset \neq K \subseteq X$  convex closed,  $K \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$ ,  $\Psi$  Euler-Legendre,  $\Psi \in C^2(\operatorname{int}(\operatorname{efd}(\Psi)))$ ,  $D_{\Psi}$  jointly convex,  $D_{\Psi}(x,\cdot)$  strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi))$  and coercive  $\forall x \in \operatorname{int}(\operatorname{efd}(\Psi))$ , norm-to-norm continuity of  $\mathfrak{P}_C^{D_{\Psi}}$  has been established in [46, Cor. 3.7]. While coerciveness of  $D_{\Psi}(x,\cdot)$  follows from supercoerciveness of  $\Psi$  [40, Lemm. 7.3.(viii)], the rest of these conditions is noticeably different from the assumptions of Proposition 3.3.(iii).
- (v) The reason why Proposition 3.4.(iv) omits case a) of Proposition 2.16.(iv) will be explained in the Remark 3.33.(x).
- (vi) Generalised pythagorean equations (93) and (57) are special cases of the generalised cosine equation (26), obtained for

$$\left[\left[x - \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x), \mathfrak{D}^{G}\Psi(y) - \mathfrak{D}^{G}\Psi(\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x))\right]\right]_{X \times X^{*}} = 0 \ \forall (x, y) \in \operatorname{int}(\operatorname{efd}(\Psi)) \times K, \tag{98}$$

and

$$\left[\left[x - \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y), \mathfrak{D}^{G}\Psi(y) - \mathfrak{D}^{G}\Psi(\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y))\right]\right]_{X \times X^{\star}} = 0 \ \forall (x, y) \in K \times \operatorname{int}(\operatorname{efd}(\Psi)), \tag{99}$$

respectively. One can see them as the conditions of orthogonality (at  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(x)$  and  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi}}(y)$ , respectively) between a vector joining the projected point with its projection, and a vector ranging from a projection into an arbitrary point within the constraint set K.

(vii) As compared to the original phrasing of [13, Thm. 3.19], Proposition 3.9.(i) assumes additionally strict convexity of  $\Psi^{\mathbf{F}}$ , since, by the definition of  $\hat{\mathfrak{P}}^{\Psi^{\mathbf{F}}}$  [13, Def. 3.1], this condition is necessary for the uniqueness of  $\hat{\mathfrak{P}}_{K^{\circ}}^{\Psi^{\mathbf{F}}}(y)$ . Proposition 3.9.(ii) is new.

### 3.2 $D_{\Psi}$ with $\Psi = \Psi_{\omega}$

**Proposition 3.11.** For any gauge  $\varphi$  and any Banach space  $(X, \|\cdot\|_X)$ ,  $\Psi_{\varphi}$  is supercoercive.

Proof. Let  $\Psi \in \Gamma(X, \|\cdot\|_X)$ . By [361, Lemm. 3.6.1],  $\Psi$  is supercoercive iff  $(\operatorname{efd}(\Psi^{\mathbf{F}}) = X^* \text{ and } \Psi^{\mathbf{F}}$  is bounded on bounded subsets). If  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) = X^*$ , then  $\Psi^{\mathbf{F}}$  is continuous on  $X^*$  [298, Cor. 7C]. If  $\Psi^{\mathbf{F}}$  is continuous on  $X^*$ , then, by [84, Prop. 1.1.11],  $\Psi^{\mathbf{F}}$  is bounded on bounded subsets iff  $\partial(\Psi^{\mathbf{F}})$  is bounded on bounded subsets. By [361, Thm. 3.7.2.(ii)],

$$(\Psi_{\varphi})^{\mathbf{F}}(y) = \int_{0}^{\|y\|_{X^{\star}}} \mathrm{d}t \, \varphi^{-|}(t) \ \forall y \in X^{\star}, \tag{100}$$

so  $(\Psi_{\varphi})^{\mathbf{F}}$  has the same properties as  $\Psi_{\varphi}$ , since  $\varphi^{-1}$  is a gauge function (cf. [361, p. 227]). In particular,  $(\Psi_{\varphi})^{\mathbf{F}}$  is convex and continuous on  $X^{\star}$ , with  $\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}) = X^{\star} = \operatorname{int}(\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}))$ . Finally, from definition (85) of  $j_{\varphi}$ , it follows:

$$\exists \lambda > 0 \; \forall z \in Z \subsetneq X^{\star} \; \; \|z\|_{X^{\star}} \leq \lambda \; \; \Rightarrow \; \; \forall y \in j^{\star}_{\varphi^{-\mathsf{I}}}(z) \; \; \|y\|_{X^{\star \star}} = \varphi^{-\mathsf{I}}(\|z\|_{X^{\star}}) \leq \varphi^{-\mathsf{I}}(\lambda), \tag{101}$$

where the last inequality holds since  $\varphi^{-1}$  is nondecreasing. Hence,  $j_{\varphi^{-1}}^{\star}$  maps bounded sets to bounded sets (cf., e.g., [227, p. 176]). Since  $j_{\varphi^{-1}}^{\star} = \partial((\Psi_{\varphi})^{\mathbf{F}})$  by (89) and (100), this completes the proof.

**Proposition 3.12.** For any gauge  $\varphi$ ,  $\Psi_{\varphi}$  is Euler–Legendre iff  $(X, \|\cdot\|_X)$  is strictly convex and Gateaux differentiable.

- Proof. 1) By Proposition 2.25.(iii),  $(X, \|\cdot\|_X)$  is Gateaux differentiable iff  $j_{\varphi}$  is single-valued on X. By [40, Thm. 5.6.(i)-(ii)],  $\Psi_{\varphi}$  is essentially Gateaux differentiable iff  $(\operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) \neq \emptyset$  and  $\partial \Psi_{\varphi}$  is single-valued on  $\operatorname{efd}(\partial \Psi_{\varphi})$ ). By [27, Thm. 1],  $j_{\varphi} = \partial \Psi_{\varphi}$ . Since  $\operatorname{efd}(\partial \Psi_{\varphi}) = X$  [101, Obs. I.3.1] and  $\operatorname{efd}(\Psi_{\varphi}) = \operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = X$  for any gauge  $\varphi$ , we obtain:  $(X, \|\cdot\|_X)$  is Gateaux differentiable iff  $\Psi_{\varphi}$  is essentially Gateaux differentiable.
  - 2) By Proposition 2.25.(ii),  $(X, \|\cdot\|_X)$  is strictly convex iff  $\Psi_{\varphi}$  is strictly convex. By [40, Lemma 5.8], if  $\operatorname{efd}(\partial \Psi_{\varphi})$  and  $\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}})$  are open, then  $(\Psi_{\varphi})$  is strictly convex on  $\operatorname{int}(\operatorname{efd}(\Psi_{\varphi}))$  iff  $\Psi_{\varphi}$  is essentially strictly convex). By [101, Obs. I.3.1],  $\operatorname{efd}(\partial \Psi_{\varphi}) = X$ . Furthermore,  $\operatorname{efd}(\Psi_{\varphi}) = \operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = X$ . From (100) it it follows that  $\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}) = X$ , which is an open set, since every Banach space is (both a closed and) an open set.

Corollary 3.13. For any gauge  $\varphi$  and any Banach space  $(X, \|\cdot\|_X)$ ,

(i) if  $(X, \|\cdot\|_X)$  is Gateaux differentiable, then

$$D_{\Psi_{\varphi}}(x,y) = \int_{0}^{\|x\|_{X}} dt \, \varphi(t) + \int_{0}^{\|j_{\varphi}(y)\|_{X^{*}}} dt \, \varphi^{-1}(t) - [x, j_{\varphi}(y)]_{X \times X^{*}} \, \forall x, y \in X;$$
 (102)

- (ii) if  $(X, \|\cdot\|_X)$  is Gateaux differentiable and  $\Psi_{\varphi}$  is totally convex, then  $\Psi_{\varphi}$  is Euler-Legendre;
- (iii) in particular, if  $(X, \|\cdot\|_X)$  is locally uniformly convex and Gateaux differentiable, then  $\Psi_{\varphi}$  is Euler-Legendre and totally convex.

*Proof.* (i) Follows from (29), (100), and Proposition 2.25.(iii).

- (ii) Follows from Proposition 3.12 combined with the fact [294, Thm. 3.1, Cor. 3.4] that total convexity of  $\Psi$  implies strict convexity of  $(X, \|\cdot\|_X)$ .
- (iii) Follows from the fact that local uniform convexity of  $(X, \|\cdot\|_X)$  implies its strict convexity, combined with Propositions 2.25.(xii) and 3.12.

Corollary 3.14. For any gauge  $\varphi$ , if  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, and Gateaux differentiable, and  $\varnothing \neq K \subseteq X$  is weakly closed, then K is left  $D_{\Psi_{\varphi}}$ -Chebyshëv iff K is convex.

*Proof.* Follows from [338, Cor. 1] combined with Proposition 3.12.

**Proposition 3.15.** For any gauge  $\varphi$ , if  $\varnothing \neq K \subseteq X$ , and  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, and Gateaux differentiable, then:

- (i) if K is convex and closed, then K is left  $D_{\Psi_{\varphi}}$ -Chebyshëv, and  $D_{\Psi_{\varphi}}$  is left pythagorean on K;
- (ii) if  $j_{\varphi}(K)$  is convex and closed, then K is right  $D_{\Psi_{\varphi}}$ -Chebyshëv, and  $D_{\Psi_{\varphi}}$  is right pythagorean on K:
- (iii)  $D_{\Psi_{\varphi}}$  (resp.,  $D_{\Psi_{\Sigma}^{\mathbf{F}}}$ ) is an information on X (resp.,  $X^{\star}$ );
- (iv)  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$  and  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$  are zone consistent.
- Proof. (i) By Proposition 3.11,  $\Psi_{\varphi}$  is supercoercive for any gauge  $\varphi$ . For any gauge  $\varphi$ , Proposition 2.25.(xii) gives that  $\Psi_{\varphi}$  is totally convex on any locally uniformly convex Banach space  $(X, \|\cdot\|_X)$ . The latter implies strict convexity, and the opposite implication is not true in general. Furthermore, by Proposition 2.25.(xi), if  $(X, \|\cdot\|_X)$  is reflexive, then (it is strictly convex and has the Radon–Riesz–Shmul'yan property) iff  $\Psi_{\varphi}$  is totally convex for any gauge  $\varphi$ . Hence, when applied to  $\Psi_{\varphi}$  (and taking into account Proposition 3.12), the weakest conditions to be assumed in Proposition 2.8.(ii) are provided by its cases (i).b) and (i).c), which turn out to be equivalent in this situation.
- (ii) Follows from (i) and Proposition 3.1.(i), taking into account that, for reflexive  $(X, \|\cdot\|_X)$ , Gateaux differentiability of  $(X, \|\cdot\|_X)$  (resp.,  $(X^*, \|\cdot\|_{X^*})$ ) implies strict convexity of  $(X^*, \|\cdot\|_{X^*})$  (resp.,  $(X, \|\cdot\|_X)$ ) [198, A.1.1].
- (iii) Follows from Corollary 2.9 and Proposition 3.1.(iii).
- (iv) Follows from  $\operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = X$ .

**Lemma 3.16.** If  $\varphi$  is a quasigauge, then:

- (i)  $\varphi^{\wedge}$ ,  $\varphi^{\vee}$ ,  $(t \mapsto \lim_{s \to ^- t} \varphi(s))^{\wedge}$ , and  $(t \mapsto \lim_{s \to ^+ t} \varphi(s))^{\vee}$  are quasigauges;
- (ii)  $\varphi^{\wedge}$  (resp.,  $\varphi^{\vee}$ ) is left (resp., right) continuous.
- Proof. (i) Nondecreasing of  $f^{\wedge}$  and  $f^{\vee}$  holds for any  $f: \mathbb{R}^+ \to [0, \infty]$  (cf., e.g., [158, Lemm. 2.3.9.a)] for  $f^{\wedge}$  and [342, Lemm. 1.(b)]<sup>19</sup>). This implies existence of left and right limits of  $f^{\wedge}(t)$  and  $f^{\vee}(t)$  at any  $t \in \mathbb{R}^+$ .  $\varphi \not\equiv 0$  (resp.,  $\varphi \not\equiv \infty$ ) implies  $\varphi^{\wedge} \not\equiv \infty \not\equiv \varphi^{\vee}$  (resp.,  $\varphi^{\wedge} \not\equiv 0 \not\equiv \varphi^{\vee}$ ). Thus,  $\exists s, t > 0$  such that  $\lim_{u \to +s} \varphi^{\wedge}(u) < \infty$  and  $\lim_{u \to +t} \varphi^{\vee}(u) < \infty$ . The same reasoning applies to  $(t \mapsto \lim_{s \to -t} \varphi(s))^{\wedge}$  and  $(t \mapsto \lim_{s \to +t} \varphi(s))^{\vee}$ .
  - (ii) This holds for any nondecreasing  $f: \mathbb{R}^+ \to [0, \infty]$ , cf., e.g., [158, Lemm. 2.3.9.c)] for  $f^{\wedge}$  and [342, Lemm. 1.(c)]<sup>19</sup> for  $f^{\vee}$ .

**Lemma 3.17.** If  $\varphi$  is a quasigauge, and  $f_{\varphi}(u) := \int_{0}^{u} dt \, \varphi(t) \, \forall u \in \mathbb{R}^{+}$ , then

$$(f_{\varphi})^{\mathbf{Y}}(u) = \int_{0}^{u} dt \left( \lim_{s \to +t} \varphi(s) \right)^{\vee} = \int_{0}^{u} dt \left( \lim_{s \to -t} \varphi(s) \right)^{\wedge} \quad \forall u \in \mathbb{R}^{+}.$$
 (103)

If, furthermore,  $\varphi$  is right (resp., left) continuous on  $\mathbb{R}^+$ , then<sup>20</sup>

$$(f_{\varphi})^{\mathbf{Y}}(u) = \int_{0}^{u} dt \, \varphi^{\vee}(t) \ \forall u \in \mathbb{R}^{+}$$
 (104)

$$(resp., (f_{\varphi})^{\mathbf{Y}}(u) = \int_0^u dt \, \varphi^{\wedge}(t) \ \forall u \in \mathbb{R}^+).$$
 (105)

*Proof.* Since  $f_{\varphi}$  and  $(f_{\varphi})^{\mathbf{Y}}$  are proper, convex, lower semicontinuous functions, taking value 0 at 0 [359, pp. 367–368], we can use the representation [301, Thm. 24.2] of such type of functions,  $g(u) = \int_0^u \mathrm{d}t \, g'_+(t) = \int_0^u \mathrm{d}t \, g'_-(t) \, \forall u \in \mathbb{R}^+$ , and combine it with [359, Prop. A.2.(i)]

$$((f_{\varphi})^{\mathbf{Y}})'_{+}(t) = (\lim_{s \to +t} \varphi(s))^{\vee}, \tag{106}$$

$$((f_{\varphi})^{\mathbf{Y}})'_{-}(t) = (\lim_{s \to -t} \varphi(s))^{\wedge}. \tag{107}$$

<sup>&</sup>lt;sup>19</sup>This lemma is stated for  $f: \mathbb{R}^+ \to \mathbb{R}^+$ , however the extension of a proof to  $f: \mathbb{R}^+ \to [0, \infty]$  by an analogy with the proof of [158, Lemm. 2.3.9] is straightforward.

<sup>&</sup>lt;sup>20</sup>(104) has been proved earlier, by a different method, in [311, Thm. 2.11].

**Lemma 3.18.** For any quasigauge  $\varphi$  and any Banach space  $(X, \|\cdot\|_X)$ 

- (i)  $(\Psi_{\varphi})^{\mathbf{F}}(y) = \int_0^{\|y\|_{X^{\star}}} \mathrm{d}t \left(\lim_{s \to +t} \varphi(s)\right)^{\vee} = \int_0^{\|y\|_{X^{\star}}} \mathrm{d}t \left(\lim_{s \to -t} \varphi(s)\right)^{\wedge} \forall y \in X^{\star};$
- (ii) if  $\varphi$  is right (resp., left) continuous on  $\mathbb{R}^+$ , then

$$(\Psi_{\varphi})^{\mathbf{F}}(y) = \int_0^{\|y\|_{X^{\star}}} \mathrm{d}t \, \varphi^{\vee}(t) \ \forall y \in X^{\star}$$
 (108)

$$(resp., (\Psi_{\varphi})^{\mathbf{F}}(y) = \int_{0}^{\|y\|_{X^{\star}}} dt \, \varphi^{\wedge}(t) \ \forall y \in X^{\star}), \tag{109}$$

$$((\Psi_{\varphi})^{\mathbf{F}})^{\mathbf{F}}(z) = \int_{0}^{\|z\|_{X^{\star\star}}} \mathrm{d}t \, (\varphi^{\vee})^{\vee}(t) \ \forall z \in X^{\star\star}$$
 (110)

$$(resp., ((\Psi_{\varphi})^{\mathbf{F}})^{\mathbf{F}}(z) = \int_{0}^{\|z\|_{X^{\star\star}}} dt \, (\varphi^{\wedge})^{\wedge}(t) \ \forall z \in X^{\star\star}), \tag{111}$$

and  $\partial((\Psi_{\varphi})^{\mathbf{F}}) = j_{\varphi^{\wedge}}^{\star} \ (resp., \ \partial((\Psi_{\varphi})^{\mathbf{F}}) = j_{\varphi^{\wedge}}^{\star});$ 

(iii) if  $\varphi$  is right (resp., left) continuous on  $\mathbb{R}^+$  and  $(X, \|\cdot\|_X)$  is reflexive, then  $j_{(\varphi^{\vee})^{\vee}}^{\star\star} = j_{\varphi}$  (resp.,  $j_{(\varphi^{\wedge})^{\wedge}}^{\star\star} = j_{\varphi}$ ).

Proof.

- (i)–(ii) By [359, Eqn. (A.6)],  $(\Psi_{\varphi})^{\mathbf{F}}(y) = (f_{\varphi})^{\mathbf{Y}}(\|y\|_{X^{\star}}) \ \forall y \in X^{\star}$ , where  $f_{\varphi}(u) = \int_{0}^{u} dt \, \varphi(t) \ \forall u \in \mathbb{R}^{+}$ . The rest follows from Lemmas 3.16 and 3.17.
  - (iii) For any  $f: \mathbb{R}^+ \to [0, \infty]$ , f is (nondecreasing and right (resp., left) continuous) iff  $f^{\vee\vee} = f$  (resp.,  $f^{\wedge\wedge} = f$ ) [311, Lemm. 2.4]<sup>21</sup> (resp., [158, Lemm. 2.3.11]). On the other hand, reflexivity of  $(X, \|\cdot\|_X)$  and  $\Psi_{\varphi} \in \Gamma(X, \|\cdot\|_X)$  give  $((\Psi_{\varphi})^{\mathbf{F}})^{\mathbf{F}} = \Psi_{\varphi}$ . Hence,  $j_{(\varphi^{\vee})^{\vee}}^{\star\star} = \partial(((\Psi_{\varphi})^{\mathbf{F}})^{\mathbf{F}}) = \partial\Psi_{\varphi} = j_{\varphi}$  in the right continuous case, and analogously in the left continuous case.

**Corollary 3.19.** If  $(X, \|\cdot\|_X)$  is a Gateaux differentiable Banach space, and a quasigauge  $\varphi$  is continuous on  $[0, \sup(\operatorname{efd}(\varphi))]$ , then  $\forall (x, y) \in X \times \inf(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X))$ 

$$D_{\Psi_{\varphi}}(x,y) = \int_{0}^{\|x\|_{X}} dt \, \varphi(t) + \int_{0}^{\|j_{\varphi}(y)\|_{X^{\star}}} dt \, (\lim_{s \to +t} \varphi(s))^{\vee} - [x, j_{\varphi}(y)]_{X \times X^{\star}}$$
(112)

$$= \int_0^{\|x\|_X} dt \, \varphi(t) + \int_0^{\|j_{\varphi}(y)\|_{X^{\star}}} dt \, (\lim_{s \to -t} \varphi(s))^{\wedge} - [x, j_{\varphi}(y)]_{X \times X^{\star}}. \tag{113}$$

If, furthermore,  $\varphi$  is right (resp., left) continuous at  $\sup(\operatorname{efd}(\varphi))$ , then

$$D_{\Psi_{\varphi}}(x,y) = \int_{0}^{\|x\|_{X}} dt \, \varphi(t) + \int_{0}^{\|j_{\varphi}(y)\|_{X^{*}}} dt \, \varphi^{\vee}(t) - [x, j_{\varphi}(y)]_{X \times X^{*}}$$
(114)

$$(resp., D_{\Psi_{\varphi}}(x, y) = \int_{0}^{\|x\|_{X}} dt \, \varphi(t) + \int_{0}^{\|j_{\varphi}(y)\|_{X^{\star}}} dt \, \varphi^{\wedge}(t) - [x, j_{\varphi}(y)]_{X \times X^{\star}})$$

$$(115)$$

 $\forall (x,y) \in X \times \operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X,\|\cdot\|_X)).$ 

*Proof.* Follows from Lemma 3.18 and Proposition 2.28.(i), applied to (29), (88), and (89).  $\Box$ 

**Proposition 3.20.** Let  $\varphi$  be a quasigauge, and let  $(X, \|\cdot\|_X)$  be a Banach space. Then:

- (i)  $j_{\varphi^{\vee}}^{\star}$  is bounded;
- (ii) if  $\varphi^{\wedge}$  is right continuous, then  $j_{\varphi^{\wedge}}^{\star}$  is bounded;
- (iii) if either  $\varphi^{\vee}$  is finite or  $\varphi^{\wedge}$  is (right continuous and finite), then  $\Psi_{\varphi}$  is supercoercive.

<sup>&</sup>lt;sup>21</sup>This lemma states only an implication from left to right, however an implication in the opposite direction can be provided by a direct analogue of the corresponding proof in [158, Lemm. 2.3.11].

- (i)–(ii) Lemma 3.16.(i) allows us to use (89) to (108) and (109). Replacing  $\varphi^{-1}$  in (101) by  $\varphi^{\vee}$  (resp.,  $\varphi^{\wedge}$ ), and using its right continuity together with (84) instead of (85), gives the boundedness of  $j_{\varphi^{\vee}}^{\star}$  (resp.,  $j_{\varphi^{\wedge}}^{\star}$ ).
  - (iii) The assumption of finiteness of  $\varphi^{\vee}$  (resp.,  $\varphi^{\wedge}$ ) guarantees that  $(f_{\varphi})^{\mathbf{Y}}(u)$ , as defined by (104) (resp., (105)), is finite  $\forall u \in \mathbb{R}^+$ . Hence,  $\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}) = X^* = \operatorname{int}(\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}))$ . Using (i)–(ii), together with [298, Cor. 7C], [84, Prop. 1.1.11], and [361, Lemm. 3.6.1], in the same way as in the proof of Proposition 3.11, gives the result.

**Proposition 3.21.** Let  $(X, \|\cdot\|_X)$  be a Banach space, and let  $\varphi$  be a quasigauge strictly increasing on  $\operatorname{efd}(\varphi)$ , continuous on  $[0, \sup(\operatorname{efd}(\varphi))]$ , and satisfying

$$\begin{cases}
j_{\varphi} \text{ is not single-valued on } \operatorname{efd}(j_{\varphi}) \setminus \operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_{X})) \\
\operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = \operatorname{efd}(\Psi_{\varphi}) \\
\operatorname{efd}(j_{\varphi}) \text{ is open} \\
\operatorname{efd}((\Psi_{\varphi})^{\mathbf{F}}) \text{ is open.}
\end{cases} (116)$$

Then  $\Psi_{\varphi}$  is Euler-Legendre iff  $(X, \|\cdot\|_X)$  is strictly convex and Gateaux differentiable.

*Proof.* Follows the same arguments as the proof of Proposition 3.12, with the properties of a gauge  $\varphi$ and of  $\Psi_{\varphi}$  replaced by the above assumptions, and with the use of Proposition 2.25.(ii)–(iii) replaced by the use of Proposition 2.28.(i)–(ii).

**Proposition 3.22.** Let  $(X, \|\cdot\|_X)$  be a reflexive, strictly convex, and Gateaux differentiable Banach space, let  $\varphi$  be a quasigauge strictly increasing on efd( $\varphi$ ) and continuous on  $[0, \sup(\text{efd}(\varphi))]$ , let  $K \cap$  $\operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) \neq \varnothing$ . Then:

- (i) if K is convex and closed, and any of the following (inequivalent) conditions holds:
  - a)  $\varphi^{\vee}$  is finite or  $\varphi^{\wedge}$  is (right continuous and finite);
  - b) (116),

then:

- 1) K is left  $D_{\Psi_{\varphi}}$ -Chebyshëv,  $D_{\Psi_{\varphi}}$  is left pythagorean on K, and  $D_{\Psi_{\varphi}}$  is an information on X;
- 2) if (i).b) or ((i).a) and  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi_{\varphi}))$ ) holds, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$  are zone consistent; (ii) if  $K \subseteq \operatorname{int}(\operatorname{efd}(\Psi_{\varphi}))$ ,  $j_{\varphi}(K)$  is convex and closed, and any of the following (inequivalent) conditions holds:

```
ions holds:

a) \begin{cases} x \\ \varphi \text{ is finite or } (\varphi^{\vee})^{\wedge} \text{ is right continuous and finite;} \end{cases}
b) \begin{cases} y \\ (\varphi^{\wedge})^{\vee} \text{ is finite or } \varphi \text{ is right continuous and finite;} \end{cases}
c) \begin{cases} x \\ \varphi^{\vee} \text{ is continuous on } [0, \sup(\text{efd}(\varphi^{\vee}))[\\ j_{\varphi^{\vee}}^{\star} \text{ is not single-valued on } \text{efd}(j_{\varphi^{\vee}}^{\star}) \setminus \inf(\sup(\text{efd}(\varphi^{\vee}))B(X^{\star}, \|\cdot\|_{X^{\star}})) \\ \inf(\text{efd}(y_{\varphi^{\vee}}^{\star}) \text{ is open} \\ \text{efd}(y_{\varphi}^{\vee}) \text{ is open;} \end{cases}
d) \begin{cases} y) \\ \varphi^{\wedge} \text{ is continuous on } [0, \sup(\operatorname{efd}(\varphi^{\wedge}))[\\ j^{\star}_{\varphi^{\wedge}} \text{ is not single-valued on } \operatorname{efd}(j^{\star}_{\varphi^{\wedge}}) \setminus \operatorname{int}(\sup(\operatorname{efd}(\varphi^{\wedge}))B(X^{\star}, \|\cdot\|_{X^{\star}})) \\ \operatorname{int}(\operatorname{efd}(\Psi_{\varphi^{\wedge}})) = \operatorname{efd}(\Psi_{\varphi^{\wedge}}) \\ \operatorname{efd}(j^{\star}_{\varphi^{\wedge}}) \text{ is open} \\ \operatorname{efd}(\Psi_{\varphi}) \text{ is open}, \end{cases}
 where
 x) \begin{cases} \varphi \text{ is right continuous on } \mathbb{R}^+ \\ \varphi^{\vee} \text{ is strictly increasing on } \operatorname{efd}(\varphi^{\vee}) \\ \Psi_{\varphi^{\vee}} \text{ is Gateaux differentiable on } \varnothing \neq j_{\varphi}(\operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_{X}))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi_{\varphi^{\vee}}));
```

```
y) \begin{cases} \varphi \text{ is left continuous on } \mathbb{R}^+ \\ \varphi^{\wedge} \text{ is strictly increasing on } \operatorname{efd}(\varphi^{\wedge}) \\ \Psi_{\varphi^{\wedge}} \text{ is Gateaux differentiable on } \varnothing \neq j_{\varphi}(\operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X,\|\cdot\|_X))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi_{\varphi^{\wedge}})), \end{cases}
```

- 1) K is right  $D_{\Psi_{\varphi}}$ -Chebyshëv,  $D_{\Psi_{\varphi}}$  is right pythagorean on K,  $D_{(\Psi_{\varphi})^{\mathbf{F}}}$  is an information on  $X^*$ , and  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi_{\varphi}}}$  is zone consistent; 2) if either c) or d) holds, then  $D_{\Psi_{\varphi}}$  is an information on X.

*Proof.* Follows directly from Propositions 3.20 and 3.21, applied to Propositions 2.8 and 3.1, and to Corollary 2.9. In (ii).a) (resp., (ii).b)) we use  $\varphi^{\vee\vee} = \varphi$  (resp.,  $\varphi^{\wedge\wedge} = \varphi$ ) for right (resp., left) continuous  $\varphi$  (cf. the proof of Lemma 3.18), while in (ii).c) and (ii).d) we use also  $((\Psi_{\varphi})^{\mathbf{F}})^{\mathbf{F}} = \Psi_{\varphi}$  that follows from  $\Psi_{\varphi} \in \Gamma(X, \|\cdot\|_X)$  and reflexivity of  $(X, \|\cdot\|_X)$ .

**Proposition 3.23.** Let  $\varnothing \neq K \subseteq X$ . For any gauge  $\varphi$ , if  $(X, \|\cdot\|_X)$  is strictly convex, Fréchet differentiable, reflexive, and has the Radon-Riesz-Shmul'yan property, then:

- (i) if K is convex and closed, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$  is norm-to-norm continuous on X, while  $\inf_{y \in K} \{D_{\Psi_{\varphi}}(y, \cdot)\}$ is continuous on X;
- (ii) if  $j_{\varphi}(K)$  is convex and closed, then  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$  is norm-to-norm continuous on X.
- (i) Taking into account Proposition 2.25.(xi), together with equivalence of Fréchet differentiability of  $(X, \|\cdot\|_X)$  with Fréchet differentiability of  $\Psi_{\varphi}$  (Proposition 2.25.(iv)), we conclude that, for any gauge  $\varphi$ , if  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, Fréchet differentiable, and has the Radon-Riesz-Shmul'yan property, then  $\Psi_{\varphi}$  is totally convex and Fréchet differentiable on X (as well as supercoercive). Hence, Proposition 3.3.(i) applies.
- (ii) By Proposition 2.25.(iv),  $j_{\varphi}$  (resp.,  $j_{\varphi^{-1}}^{\star}$ ) is norm-to-norm continuous iff  $(X, \|\cdot\|_X)$  (resp.,  $(X^{\star}, \|\cdot\|_{X^{\star}})$ ) is Fréchet differentiable (and, in such case,  $j_{\varphi} = \mathfrak{D}^{\mathrm{F}}\Psi_{\varphi}$  (resp.,  $j_{\varphi^{-|}}^{\star} = \mathfrak{D}^{\mathrm{F}}((\Psi_{\varphi})^{\mathbf{F}})$ )). By [21, Thm. 3.9], if  $(X, \|\cdot\|_X)$  is reflexive, then  $(X^*, \|\cdot\|_{X^*})$  is Fréchet differentiable iff  $((X, \|\cdot\|_X))$  is strictly convex and has the Radon-Riesz-Shmul'yan property). Hence, Equation (58) is a composition of norm-to-norm continuous functions, and thus it is norm-to-norm continuous, under the same assumptions on  $\Psi$  as in (ii).
- (ii') Follows from Proposition 3.3.(iii).

**Proposition 3.24.** Let  $\varphi$  be any gauge.

- (i) If  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable and strictly convex, then  $\Psi_{\varphi}$  is LSQ-adapted on any convex and closed  $\varnothing \neq K \subseteq X$ , and  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi_{\varphi}}}$  is adapted for any  $\varnothing \neq C \subseteq K$  with convex and  $closed\ C.$
- (ii) If  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable, strictly convex, and has the Radon-Riesz-Shmul'yan property, then  $\Psi_{\varphi}$  is LSQ-compositional and RSQ-compositional.
- (ii) If  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable and uniformly convex, then:
  - a)  $\Psi_{\varphi}$  is RSQ-adapted on any  $\varnothing \neq K \subseteq X$ , and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi_{\varphi}}}$  is adapted for any  $\varnothing \neq C \subseteq K$  with convex and closed  $j_{\varphi}(C)$ ;
  - b) For any  $\emptyset \neq K \subseteq X$  and  $T: K \to X$ ,

$$T \in \mathrm{RSQ}(\Psi_{\varphi}, K) \iff j_{\varphi} \circ T \circ (j_{\varphi})^{-1} \in \mathrm{LSQ}(\Psi_{\varphi}, j_{\varphi}(K)).$$
 (117)

- Proof(i)—(ii) By Proposition 2.25.(v),  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable iff  $\Psi_{\varphi}$  is uniformly Fréchet differentiable on bounded subsets of X. By Proposition 2.25.(xi), if  $(X, \|\cdot\|_X)$  is reflexive, then (it is strictly convex and has the Radon–Riesz–Shmul'yan property) iff  $\Psi_{\varphi}$  is totally convex on X. The rest follows from Proposition 3.4.(i).a), as well 3.4.(i).b) and 3.4.(ii)-(iii), due to supercoercivity of  $\Psi_{\omega}$  (Proposition 3.11) and because total convexity on X implies total convexity on bounded subsets of X.
  - (ii) By Proposition 2.25.(vi), uniform convexity of  $(X, \|\cdot\|_X)$  is equivalent with uniform Fréchet differentiability of  $(\Psi_{\varphi})^{\mathbf{F}}$  on bounded subsets of  $(X^{\star}, \|\cdot\|_{X^{\star}})$ . By Propositions 3.4.(iv) and 3.4.(v), this gives, respectively, (ii).a) and (ii).b).

- $\begin{array}{l} \textbf{Proposition 3.25. } \ Let \ \gamma \in ]0,\frac{1}{2}]. \\ (i) \ \ If \ \varphi(t) \in \left\{ \frac{1}{1-\gamma} t^{\frac{\gamma}{1-\gamma}}, t^{\frac{\gamma}{1-\gamma}} \right\}, \ then \ (X,\|\cdot\|_X) \ \ is \ \frac{1}{\gamma} \text{-uniformly convex iff } j_{\varphi}^{\star} \ \ on \ (X^{\star},\|\cdot\|_{X^{\star}}) \ \ is \ singlevalued \ \ and \ \frac{\gamma}{1-\gamma} \text{-Lipschitz-H\"{o}lder continuous on } X. \end{array}$ 
  - (ii) Let  $\varphi(t) \in \left\{ (1-\gamma)^{\frac{1-\gamma}{\gamma}} t^{\frac{1-\gamma}{\gamma}}, t^{\frac{1-\gamma}{\gamma}} \right\}$ . If  $(X, \|\cdot\|_X)$  is  $\frac{1}{\gamma}$ -uniformly convex, then  $(j_{\varphi})^{-1}$  is single-valued and  $\frac{\gamma}{1-\gamma}$ -Lipschitz-Hölder continuous on X.
- (i) Follows from equivalence of  $\frac{1}{\gamma}$ -uniform convexity of  $(X, \|\cdot\|_X)$  and  $\frac{1}{1-\gamma}$ -uniform Fréchet differentiability of  $(X^*, \|\cdot\|_{X^*})$  [226, p. 63 (Vol. 2)] combined with Proposition 2.25.(viii).b)-c).
- (ii) Follows from (i), Proposition 2.25.(viii).b)-c), and Equation (86).

**Proposition 3.26.** Let  $\lambda \in ]0,1[$ , let  $(X,\|\cdot\|_X)$  be reflexive, let  $\varphi$  be a gauge, let  $f \in \Gamma(X,\|\cdot\|_X)$  be bounded from below, and  $\lim_{\|x\|_{X}\to\infty} f(x) = \infty$ . Then:

- (i) if  $(X, \|\cdot\|_X)$  is strictly convex and Gateaux differentiable, then  $\overleftarrow{\operatorname{prox}}_{\lambda, f}^{D_{\Psi_{\varphi}}}$  is single-valued and continuous on X;
- erty, then  $\overrightarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi_{\varphi}}}$  is single-valued and continuous on X.

*Proof.* Follows from Proposition 3.5.(i)–(ii), and the same reasoning as in the proof of Proposition 3.23.(i)-(ii).

**Proposition 3.27.** Let  $(X, \|\cdot\|_X)$  be a Banach space, let  $\varphi$  be a gauge, and let  $T: X \to 2^{X^\star}$  be maximally monotone with  $0 \in \text{efd}(T)$ . Then:

- (i) if  $(X, \|\cdot\|_X)$  is Fréchet differentiable and uniformly convex, then  $\overleftarrow{\operatorname{res}}_T^{\Psi_{\varphi}} = (T+j_{\varphi})^{-1} \circ j_{\varphi}$  maps Xon efd(T) and is norm-to-norm continuous on X;
- (ii) if  $(X, \|\cdot\|_X)$  is strictly convex, uniformly Fréchet differentiable, and has Radon-Riesz-Shmul'yan property, then  $\overrightarrow{\operatorname{res}}_T^{\Psi_{\varphi}} = (j_{\varphi})^{-|} \circ (T + j_{\varphi})^{-|}$  maps  $X^{\star}$  on  $j_{\varphi}(\operatorname{efd}(T))$  and is norm-to-norm continuous
- (i) By [75, Thm. 5.(c)], if  $(X, \|\cdot\|_X)$  is Gateaux differentiable and uniformly convex,  $\varphi$  is a gauge, and  $T: X \to 2^{X^*}$  is maximally monotone with  $0 \in \operatorname{efd}(T)$ , then  $(T+j_{\varphi})^{-1}$  is a norm-to-Proof. norm continuous map from  $X^*$  to efd(T). (While the explicit statement of this theorem assumes additionally that  $T = \partial f$  for  $f \in \Gamma(X, \|\cdot\|_X)$ , its proof does not depend on this assumption.) The rest follows from Proposition 2.25.(iv).b) and composability of norm-to-norm continuous maps on Banach spaces.
  - (ii) From Proposition 2.18.(i) it follows that  $\overrightarrow{\operatorname{res}}_T^{\Psi_{\varphi}} = \mathfrak{D}^{\operatorname{G}}\Psi_{\varphi} \circ \overleftarrow{\operatorname{res}}_T^{\Psi_{\varphi}} \circ \mathfrak{D}^{\operatorname{G}}(\Psi_{\varphi})^{\mathbf{F}}$  with  $\operatorname{efd}(\overrightarrow{\operatorname{res}}_T^{\Psi_{\varphi}}) = \operatorname{Constant}_T \circ \operatorname{Constant}_T \circ$  $\mathfrak{D}^{\mathrm{G}}\Psi_{\varphi}(\mathrm{efd}(\overrightarrow{\mathrm{res}}_{T}^{\Psi_{\varphi}}))$  and  $\mathrm{ran}(\overrightarrow{\mathrm{res}}_{T}^{\Psi_{\varphi}}) = \mathfrak{D}^{\mathrm{G}}\Psi_{\varphi}(\mathrm{ran}(\overrightarrow{\mathrm{res}}_{T}^{\Psi_{\varphi}}))$ . Furthermore, due to (89) and (100),  $(\Psi_{\varphi})^{\mathbf{F}} = \Psi_{\varphi^{-|}}$  and  $(j_{\varphi})^{-|} = j_{\varphi^{-|}}^{\star}$ . The rest follows from (i), combined with the equivalence of (Gateaux differentiability and uniform convexity of  $(X, \|\cdot\|_X)$ ) with (strict convexity and uniform Fréchet differentiability of  $(X^*, \|\cdot\|_{X^*})$ , Proposition 2.25.(iv).b) applied to  $j_{\varphi}$  and  $j_{\varphi^{-1}}^*$ , and the  ${\it fact~[21,~Thm.~3.9]~that~(reflexivity,~strict~convexity,~and~Radon-Riesz-Shmul'yan 'property~of'}$  $(X, \|\cdot\|_X)$ ) implies Fréchet differentiability of  $(X^*, \|\cdot\|_{X^*})$ .

**Proposition 3.28.** Let  $(X, \|\cdot\|_X)$  be a Banach space, let  $\varphi_{1,\beta}(t) = t^{1/\beta-1}$ , let  $T: X \to 2^{X^*}$  be maximally monotone, let  $f \in \Gamma(X, \|\cdot\|_X)$ , let  $g: X \to ]-\infty, \infty]$  satisfy  $g \circ j_{\varphi_{1,1-\beta}} \in \Gamma(X^\star, \|\cdot\|_{X^\star})$ , let  $\lambda \in ]0, \infty[$  and  $r \in ]1, 2]$ . Then:

(i) if  $\beta \in ]0, \frac{1}{2}]$  and  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex and uniformly Fréchet differentiable, then  $\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}}$ and  $\operatorname{\overline{prox}}_{\lambda,f}^{D_{\Psi\varphi_{1,\beta}}}$  are single-valued and uniformly continuous on bounded subsets of X;

- (ii) if  $\beta \in ]0, \frac{1}{2}]$  and  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex and r-uniformly Fréchet differentiable, then
- $\stackrel{\longleftarrow}{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} \ and \ \stackrel{\longleftarrow}{\operatorname{prox}}_{\lambda,f}^{D_{\Psi_{\varphi_{1,\beta}}}} \ are \ single-valued \ and \ (r-1)\frac{\beta}{1-\beta}-Lipschitz-H\"{o}lder \ continuous \ on \ X;$  (iii) if  $\beta \in [\frac{1}{2},1[\ and\ (X,\|\cdot\|_X)\ is \ uniformly \ convex \ and \ \frac{1}{\beta}-uniformly \ Fr\'{e}chet \ differentiable, \ then \ D_{r}$  $\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} \ is \ single-valued \ and \ uniformly \ continuous \ on \ bounded \ subsets \ of \ X^{\star}, \ while \ \overrightarrow{\operatorname{prox}}_{\lambda,g}^{D_{\Psi_{\varphi_{1,\beta}}}} \ is \ single-valued \ and \ uniformly \ continuous \ on \ bounded \ subsets \ of \ X;$
- (iv) if  $\beta \in [\frac{1}{2}, 1[$  and  $(X, \|\cdot\|_X)$  is  $\frac{r}{r-1}$ -uniformly convex and  $\frac{1}{\beta}$ -uniformly Fréchet differentiable, then  $\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} \ \ is \ single-valued \ and \ (\tfrac{(1-\beta)(r-1)}{\beta})^2 - Lipschitz - H\"{o}lder \ continuous \ on \ bounded \ subsets \ of \ X^\star,$ while  $\overrightarrow{\text{prox}}_{\lambda,g}^{D_{\Psi\varphi_{1},\beta}}$  is single-valued and  $(\frac{(1-\beta)(r-1)}{\beta})^2$ -Lipschitz-Hölder continuous on bounded sub-
- (i) By [286, Ex. 6.7], if  $(X, \|\cdot\|_X)$  is Gateaux differentiable and  $\frac{1}{\beta}$ -uniformly convex, then  $(\mathfrak{D}^{G}\Psi_{\varphi_{1,\beta}} + \lambda T)^{-1}$  is single-valued and  $\frac{\beta}{1-\beta}$ -Lipschitz-Hölder continuous on X. Combining this with Proposition 2.25.(v).b) gives the result for  $\overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}}$ . The result for  $\overleftarrow{\operatorname{prox}}_{\lambda,f}^{D_{\Psi_{\varphi_{1,\beta}}}}$  follows in the same way as in Proposition 3.6. (Equivalently, the same conclusion follows from Proposition 3.6, combined with Propositions 2.25.(v).b) and 2.25.(vii).b).)
  - (ii) Follows from the proof of (i), Proposition 2.25.(viii).c), and the fact that the composition of Lipschitz-Hölder continuous maps has the exponent given by the multiplication of the exponents of the composite maps.
- (iii) From Proposition 2.18.(i), we obtain

$$\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} = j_{\varphi_{1,\beta}} \circ \overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} \circ (j_{\varphi_{1,\beta}})^{-1}. \tag{118}$$

The result for  $\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}}$  follows from combining (i) with Propositions 2.25.(vi).c) and 2.25.(v).b), and with the fact that  $\frac{1}{\beta}$ -uniform Fréchet differentiability of  $(X, \|\cdot\|_X)$  implies its Fréchet differentiability of  $(X, \|\cdot\|_X)$ entiability. The result for  $\overrightarrow{\text{prox}}_{\lambda,q}^{D_{\Psi\varphi_{1,\beta}}}$  follows the same way, using Proposition 2.18.(ii).

(iv) By

$$(j_{\varphi_{1,\beta}})^{-|} = (\mathfrak{D}^{G}\Psi_{\varphi_{1,\beta}})^{-|} = \mathfrak{D}^{G}((\Psi_{\varphi_{1,\beta}})^{\mathbf{F}}) = j_{(\varphi_{1,\beta})^{-|}}^{\star} = j_{\varphi_{1,1-\beta}}^{\star}, \tag{119}$$

(118) gives

$$\overrightarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} = j_{\varphi_{1,\beta}} \circ \overleftarrow{\operatorname{res}}_{\lambda T}^{\Psi_{\varphi_{1,\beta}}} \circ j_{\varphi_{1,1-\beta}}^{\star}. \tag{120}$$

By [226, p. 63 (Vol. 2)],  $\frac{1}{\gamma}$ -uniform convexity of  $(X, \|\cdot\|_X)$  is equivalent with  $\frac{1}{1-\gamma}$ -uniform Fréchet differentiability of  $(X^*, \|\cdot\|_{X^*}) \ \forall \gamma \in ]0, \frac{1}{2}]$ . By [193, Cor. 2.35], if a Banach space  $(X, \|\cdot\|_X)$  is s-uniformly Fréchet differentiable,  $s \in ]1, 2]$ , <sup>22</sup> and  $w \in ]1, \infty[$ , then  $j_{\varphi_{1,1/w}}$  is single-valued and  $\min\{w-1, s-1\}$ -Lipschitz-Hölder continuous on bounded subsets of X. Setting  $1-\beta=w$  for  $\beta \in [\frac{1}{2}, 1[$  gives  $w \in [2, \infty[$ , hence  $\min\{\frac{1}{1-\beta}-1, r-1\}=r-1$ . Combining this with (ii) and with Proposition 2.25.(viii).c), we obtain that the map (120) is  $\frac{1-\beta}{\beta} \left(\frac{1-\beta}{\beta}(r-1)\right)(r-1)$ -Lipschitz-

Hölder continuous on  $X^*$ . The result for  $\overrightarrow{\operatorname{prox}}_{\lambda,q}^{D_{\Psi\varphi_{1,\beta}}}$  follows completely analogously.

 $\textbf{Proposition 3.29.} \ \ Let \ (X,\|\cdot\|_X) \ \ be \ \ a \ \ Banach \ space, \ \beta \in \ ]0,1[,\ r \in \ ]1,2], \ \varphi_{1,\beta}(t) := t^{1/\beta-1}, \ \varnothing \neq K \subseteq \mathbb{C}$ X. Then:

- (i) if  $\beta \in ]0, \frac{1}{2}]$ ,  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex and uniformly Fréchet differentiable, and K is convex and uniformly frechet differentiable. and closed, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1},\beta}}}$  is uniformly continuous on bounded subsets of X; (ii) if  $\beta \in ]0, \frac{1}{2}]$ ,  $(X, \|\cdot\|_{X})$  is  $\frac{1}{\beta}$ -uniformly convex and r-uniformly Fréchet differentiable, and K is
- convex and closed, then  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi\varphi_{1,\beta}}}$  is  $\frac{\beta(r-1)}{1-\beta}$ -Lipschitz-Hölder continuous on X;

<sup>&</sup>lt;sup>22</sup>While [193, Cor. 2.35] uses  $s \in ]1, \infty]$ , the limitation to  $s \in ]1, 2]$  follows from the fact that there are no s-uniformly Fréchet differentiable spaces for (s < 1 as well as) s > 2 (cf., e.g., [351, pp. 8–9] for a proof).

- (iii) if  $\beta \in [\frac{1}{2}, 1[, (X, \|\cdot\|_X) \text{ is } \frac{1}{\beta}\text{-uniformly Fr\'echet differentiable and uniformly convex, and } j_{\varphi_{1,\beta}}(K)$  is convex and closed, then  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi_{\varphi_{1,\beta}}}}$  is uniformly continuous on bounded subsets of X; (iv) if  $\beta \in [\frac{1}{2}, 1[, (X, \|\cdot\|_X) \text{ is } \frac{1}{\beta}\text{-uniformly Fr\'echet differentiable and } \frac{r}{r-1}\text{-uniformly convex, and } \frac{r}{r-1}$
- (iv) if  $\beta \in [\frac{1}{2}, 1[, (X, \|\cdot\|_X) \text{ is } \frac{1}{\beta}]$ -uniformly Fréchet differentiable and  $\frac{r}{r-1}$ -uniformly convex, and  $j_{\varphi_{1,\beta}}(K)$  is convex and closed, then  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi_{\varphi_{1,\beta}}}}$  is  $\frac{(1-\beta)^2}{\beta^2}(r-1)^2$ -Lipschitz-Hölder continuous on bounded subsets of X.

Proof(i)—(ii) Follows from Propositions 3.28.(i)—(ii) and 2.19.(ii), by setting  $T = \partial \iota_K$  and  $\lambda = 1$ .

(iii) Follows from (i), taken together with (58), analogously to the proof of Proposition 3.28.(iii), using (119), and replacing (120) by

$$\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}(x) = j_{\varphi_{1,1-\beta}}^{\star} \circ \overleftarrow{\mathfrak{P}}_{j_{\varphi_{1,\beta}}(K)}^{D_{\Psi_{\varphi_{1,1-\beta}}}} \circ j_{\varphi_{1,\beta}}(x) \ \forall x \in X.$$
 (121)

(iv) Follows from (ii), analogously to the proof of Proposition 3.28.(iv), with the same substitution as in (iii).

**Definition 3.30.** Let  $\varphi$  be a gauge. A Banach space  $(X, \|\cdot\|_X)$  will be called  $\varphi$ -uniformly convex (resp.,  $\varphi$ -uniformly Fréchet differentiable) iff  $\Psi_{\varphi}$  is uniformly convex (resp., uniformly Fréchet differentiable) on  $(X, \|\cdot\|_X)$ .

Corollary 3.31. For any gauge  $\varphi$ , a Banach space  $(X, \|\cdot\|_X)$  is  $\varphi$ -uniformly convex (resp.,  $\varphi$ -uniformly Fréchet differentiable) iff  $(X^*, \|\cdot\|_{X^*})$  is  $\varphi$ -uniformly Fréchet differentiable (resp.,  $\varphi$ -uniformly convex).

*Proof.* Follows directly from Lemma 3.8.

**Proposition 3.32.** If  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, Gateaux differentiable,  $\varphi$  is a gauge,  $\varnothing \neq K_1 \subset X$  is a closed convex cone with a vertex at  $0 \in X$ ,  $\varnothing \neq K_2 \subset X$ ,  $j_{\varphi}(K_2)$  is a closed convex cone with a vertex at  $0 \in X^*$ , then

$$\forall x \in X \quad \left\{ \begin{array}{l} x = j_{\varphi^{-|}}^{\star} \circ \hat{\mathfrak{P}}_{K_{1}^{\circ}}^{(\Psi_{\varphi})^{\mathbf{F}}} \circ j_{\varphi}(x) + \overleftarrow{\mathfrak{P}}_{K_{1}}^{D_{\Psi_{\varphi}}}(x) \\ \left[ \left[ \overleftarrow{\mathfrak{P}}_{K_{1}}^{D_{\Psi_{\varphi}}}(x), \hat{\mathfrak{P}}_{K_{1}^{\circ}}^{(\Psi_{\varphi})^{\mathbf{F}}} \circ j_{\varphi}(x) \right] \right]_{X \times X^{\star}} = 0, \end{array} \right. \tag{122}$$

$$\forall y \in X \quad \left\{ \begin{array}{l} y = \hat{\mathfrak{P}}^{\Psi_{\varphi}}_{(j_{\varphi}(K_2))^{\circ}}(y) + \overrightarrow{\mathfrak{P}}^{D_{\Psi_{\varphi}}}_{K_2}(y) \\ \left[ \left[ j_{\varphi^{-1}}^{\star} \circ \overrightarrow{\mathfrak{P}}^{D_{\Psi_{\varphi}}}_{K_2}(y), \hat{\mathfrak{P}}^{\Psi_{\varphi}}_{(j_{\varphi}(K_2))^{\circ}}(y) \right] \right]_{X \times X^{\star}} = 0, \end{array} \right. \tag{123}$$

where, for any strictly convex function f and convex closed set C,  $\hat{\mathfrak{P}}_{C}^{f}(x) := \arg\inf_{z \in C} \{\Psi(x-z)\}$   $\forall x \in X$  and  $\hat{\mathfrak{P}}_{C}^{f} \circ \hat{\mathfrak{P}}_{C}^{f}(x) = \hat{\mathfrak{P}}_{C}^{f}(x) \ \forall x \in X$ . Furthermore, if  $\varnothing \neq K_{1} \subseteq X$  (resp.,  $\varnothing \neq j_{\varphi}(K_{2}) \subseteq X^{\star}$ ) is a linear subspace instead of a closed convex cone, then (122) (resp., (123)) holds under replacement of  $(\cdot)^{\circ}$  with  $(\cdot)^{\perp}$ .

*Proof.* Follows from Propositions 3.9, 2.25.(ii)–(iii), 3.11, and Equation (86).

- Remark 3.33. (i) Equations (102) and (112)–(115) are new. The same holds for the equations in Lemma 3.18. The first implicit appearance of the formula equivalent to a statement of non-negativity of  $D_{\Psi_{\varphi}}$  (more precisely, of  $D_{\Psi_{\varphi}}^{\partial}$ ) can be found in [27, Thm. 1]. (Nonnegativity of  $D_{\Psi}$  as a condition characterising monotonicity of  $\partial\Psi$  appeared earlier, in [185, Thm. 3].) For  $\Psi = \Psi_{\varphi_{1/2,1/2}}$  and  $\Psi = \Psi_{\varphi_{1,\beta}}$ ,  $\beta \in ]0,1[$ , an identification of this formula as corresponding to the Vaĭnberg–Brègman functional, together with a study of  $\mathfrak{P}^{D_{\Psi}}$ , was made in [8, §7] and [10, §7].
  - (ii) Proposition 3.12 clarifies relationships between the Euler-Legendre property and total convexity of  $\Psi_{\varphi}$ : the former is equivalent to (strict convexity and Gateaux differentiability) of  $(X, \|\cdot\|_X)$ , while the latter is implied by the local uniform convexity of  $(X, \|\cdot\|_X)$ , hence it entails strict convexity and the Radon-Riesz-Shmul'yan property of  $(X, \|\cdot\|_X)$  (implication of the latter property is proved in [341, Prop. (p. 352)]). The lack of Gateaux differentiability in the latter case should

be seen in the context of total convexity being defined by  $\mathfrak{D}_+^G\Psi$  (and thus  $D_\Psi^+$ ) instead of  $\mathfrak{D}^G\Psi$ (and thus  $D_{\Psi}$ ). For reflexive  $(X, \|\cdot\|_X)$ ,  $\Psi_{\varphi}$  is totally convex iff  $(X, \|\cdot\|_X)$  is strictly convex and has the Radon-Riesz-Shmul'yan property [294, Thm. 3.1, Thm. 3.3]. An example of a reflexive, strictly convex, Gateaux differentiable Banach space  $(X, \|\cdot\|_X)$  which does not satisfy the Radon-Riesz-Shmul'yan property, so  $\Psi_{\varphi}$  is Euler-Legendre but is not totally convex, is provided in [42,

- (iii) Let  $(X, \|\cdot\|_X)$  be a Banach space, let  $\emptyset \neq K \subseteq X$  be convex and closed, and consider a **metric** 
  - **projection**, defined as a set-valued map  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}: X \ni x \mapsto \arg\inf_{y \in K} \{\|y x\|_{X}\} \subseteq K$ . Then:

    a)  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}$  exists and is unique (i.e. K is a Chebyshëv set:  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}(x) = \{*\} \ \forall x \in X \}$  iff  $(X, \|\cdot\|_{X})$  is strictly convex and reflexive [200, p. 292]<sup>23</sup>;
    - b)  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}$  is norm-to-norm (resp., norm-to-weak) continuous on X iff  $(X, \|\cdot\|_{X})$  is strictly convex, reflexive, and satisfies the Radon-Riesz-Shmul'yan property [337, Thm. (p. 813)]<sup>24</sup> (resp., |250, Thm. 2.16|).

Proposition 3.15.(i)–(ii) (resp., Proposition 3.23) can be seen as a Vainberg–Brègman analogue of implication from right to left in a) (resp., b)). Furthermore, Proposition 3.29 provides a Vaı̆nberg-Brègman analogue of the facts:

- c) if  $(X, \|\cdot\|_X)$  is uniformly convex, then  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  are uniformly continuous on bounded subsets of X [272, Thm. 4.1]<sup>25</sup>;
- d) if  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex, with  $\beta \in ]0, \frac{1}{2}]$ , then  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  are  $\beta$ -Lipschitz–Hölder continuous on bounded neighbourhoods of K [2, Thm. 5.7];
- e) if  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex and r-uniformly Fréchet differentiable, with  $\beta \in ]0, \frac{1}{2}]$  and  $r \in ]1,2]$ , then  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  are  $r\beta$ -Lipschitz–Hölder continuous on bounded neighbourhoods of K

In general, the results on behaviour of  $D_{\Psi_{\omega}}$ -projections (existence and uniqueness, norm-to-norm continuity, uniform continuity, Lipschitz-Hölder continuity) require stronger sufficient conditions on  $\|\cdot\|_X$  than those which are sufficient for the corresponding properties of metric projections. In all of these cases the additional strengthening guarantees a suitable differentiability of  $\Psi_{\varphi}$  (or its Mandelbrojt-Fenchel dual), which is equivalent with a suitable continuity of  $j_{\varphi}$  (or, respectively,  $j_{\varphi^{-|}}^{\star}$ ).

The characterisation results a) and b), considered in parallel to the characterisation provided by Proposition 3.12, leads us to ask:

1) are the conditions for K being left  $D_{\Psi_{\varphi}}$ -Chebyshëv (resp., for norm-to-norm continuity of  $\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi}}}$ ), imposed in Proposition 3.15 (resp., Proposition 3.23.(i)), not only sufficient but also necessary?

Additionally, a comparison of a) and b) with c), as well as a comparison of c) and Proposition 3.29.(i)–(ii) with d)–e), in the context of Proposition 2.25, leads us to ask:

<sup>&</sup>lt;sup>23</sup>An implication from right to left was proved earlier in [116, Lemm. (p. 316)]. Two key components of the characterisation result were: 1) the characterisation of strict convexity in [208, p. 179], implying equivalence of strict convexity of  $(X, \|\cdot\|_X)$  and uniqueness of  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$ ; 2) the characterisation of reflexivity in [173, p. 167] [174, Thm. 5], implying equivalence of reflexivity of  $(X, \|\cdot\|_X)$  and existence of  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  [274, p. 253]. Cf., e.g., [250, Thm. 2.9] and [251, Thm. 5.1.18, p. 436] for more details.

<sup>&</sup>lt;sup>24</sup>[139, Thm. 8] proved an implication from right to left, while [337, Thm. (p. 813)] established equivalence of normto-norm continuity of  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}$  with  $(X,\|\cdot\|_{X})$  being strictly convex and having the Efimov–Stechkin property (cf. also [270, Thm. (p. 459), p. 466] for an earlier, and equivalent, characterisation result). By [316, Cor. 3] (cf. also [336, Prop. 2.5]), this is equivalent to say that  $(X, \|\cdot\|_X)$  is strictly convex, reflexive, and has the Radon-Riesz-Shmul'yan property. (The claim of a counterexample for this characterisation, stated in [211, Thm. 2.1], has been shown [123, §5] to contain an error, invalidating this claim. On the other hand, the claim of characterisation of norm-to-norm continuity of  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}$ by (reflexivity and strict convexity) of  $(X, \|\cdot\|_X)$ , stated in [238, Thm. E], is not equipped with any proof, and refers to a paper that has never been published or cited elsewhere.)

<sup>&</sup>lt;sup>25</sup>For uniformly convex and uniformly Fréchet differentiable  $(X, \|\cdot\|_X)$  this implication has been obtained earlier in [350, Thm. 2.(ii)] [16, Thm. 3.1, Rem. 3.2] [9, Thm. 3.1, Rem. 3.4]. For uniformly convex (resp., uniformly convex and uniformly Fréchet differentiable)  $(X, \|\cdot\|_X)$  the implication of uniform continuity of  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  on bounded neighbourhoods of K has been obtained earlier in [49, Lemm. 2.5] (resp., [347, Thm. 4]).

- 2) does uniform continuity of  $\mathfrak{P}_K^{d_{\|\cdot\|_X}}$  on bounded subsets of  $(X,\|\cdot\|_X)$  imply (and, thus, characterise) uniform convexity of  $(X, \|\cdot\|_X)$ ?;
- 3) do the results d)-e) hold, with the same values of parameters, globally (i.e. for the Lipschitz-
- Hölder continuity of  $\mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}$  on bounded subsets of  $(X,\|\cdot\|_{X})$ ? (iv) For any Gateaux differentiable  $(X,\|\cdot\|_{X})$ , consider a family  $\varphi(t)=\varphi_{\alpha,\beta}(t):=\frac{1}{\alpha}t^{1/\beta-1}$  with  $\beta\in ]0,1[$  and  $\alpha\in ]0,\infty[$ . Then  $\Psi_{\varphi_{\alpha,\beta}}(x)=\frac{\beta}{\alpha}\|x\|_{X}^{1/\beta},\ \mathfrak{D}^{\mathrm{G}}\Psi_{\varphi_{\alpha,\beta}}(x)=\frac{1}{\alpha}\|x\|_{X}^{1/\beta-2}j(x)$ , and we obtain a special case of (102), given by

$$D_{\Psi_{\varphi_{\alpha,\beta}}}(x,y) = \frac{1}{\alpha} \left( \beta \|x\|_X^{1/\beta} + (1-\beta) \|y\|_X^{1/\beta} - \|y\|_X^{1/\beta-2} [x,j(y)]_{X \times X^*} \right) \ \forall x,y \in X.$$
 (124)

The formula (124) is a tiny generalisation of  $D_{\Psi_{\varphi_{1,\beta}}}$ . For some discussion of the properties of  $\Psi_{\varphi_{\alpha,\beta}}$  see [172, p. 616].

- (v) Proposition 3.12 provides a generalisation of [40, Lemm. 6.2]. The latter is recovered for  $\varphi(t)$  =  $t^{\frac{1}{\beta}-1}$  with  $\beta \in ]0,1[$ , i.e. for  $\varphi = \varphi_{\alpha,\beta}$  with  $\alpha = 1$ . For any Gateaux differentiable  $(X,\|\cdot\|_X)$ ,  $\mathfrak{D}^{\mathrm{G}}\Psi_{\varphi_{1,\beta}}(x)=\|x\|_X^{\frac{1}{\beta}-2}j(x)$  (cf. [229]). The corresponding Vaı̆nberg–Brègman function appeared implicitly in [353, p. 68], and was explicitly discussed, together with a study of  $\mathfrak{P}_{K}^{D_{\Psi_{\varphi_{1},\beta}}}$  for nonempty, closed, convex  $K \subseteq X$ , in [8, pp. 14–15] and [10, §7], as well as in [308, 309, 310]. For any  $(X, \|\cdot\|_X)$  which is reflexive, strictly convex, and has the Radon-Riesz-Shmul'yan property, the total convexity of  $\Psi_{\varphi_{1,\beta}}$  follows directly from [294, Thm. 3.1].
- (vi) Proposition 3.23.(i) is a generalisation of [294, Cor. 4.4]. The latter is recovered for  $\varphi(t)$  $\frac{1}{\beta}t^{\frac{1}{\beta}-1}$  with  $\beta \in ]0,1[$ , i.e. for  $\varphi = \varphi_{\alpha,\beta}$  with  $\alpha = \beta$  (for a Gateaux differentiable  $(X, \|\cdot\|_X)$ , the corresponding  $D_{\Psi_{\varphi_{\beta,\beta}}}$  was discussed in [14, 86]). The use of Proposition 3.3.(i) (resp., 3.3.(iii)) in the proof of Proposition 3.23.(i) (resp., 3.23.(ii)), instead of Proposition 3.3.(ii) (resp., 3.3.(iv)) is due to their larger generality in the  $\Psi = \Psi_{\varphi}$  case. More precisely, since 3.3.(ii) requires  $\Psi_{\varphi}$  to be totally convex on bounded subsets of X, and any  $\Psi \in \Gamma(X, \|\cdot\|_X)$  is totally convex on bounded subsets of X iff it is uniformly convex on bounded subsets of X [85, Prop. 4.2], Proposition 2.25.(vi) implies that  $(X, \|\cdot\|_X)$  has to be uniformly convex. Thus, using Proposition 3.3.(ii) instead of Proposition 3.3.(i) in the proof would require us to strengthen an assumption of (reflexivity, strict convexity, and the Radon–Riesz–Shmul'yan property of  $(X, \|\cdot\|_X)$ ) to uniform convexity. Analogous situation holds for the Proposition 3.23.(ii).
- (vii) Let  $\alpha = 1$  and  $\beta = \frac{1}{2}$ , hence  $\varphi_{\alpha,\beta}(t) = t$  and  $\Psi_{\varphi_{1,1/2}}(x) = \frac{1}{2} \|x\|_X^2$ . If  $(X, \|\cdot\|_X)$  is Gateaux differentiable, then  $\mathfrak{D}^{G}\Psi_{\varphi_{1,1/2}} = \|\cdot\|_{X}\mathfrak{D}^{G}\|\cdot\|_{X} = j$  and we obtain a special case of (124), given by [15, p. 1035] [7, p. 5] [8, §7] [10, §7] (cf. also [356, Def. 1])

$$D_{\Psi_{\varphi_{1,1/2}}}(x,y) = \frac{1}{2} \|x\|_X^2 + \frac{1}{2} \|y\|_X^2 - [x,j(y)]_{X \times X^*} \ \forall x, y \in X.$$
 (125)

In general, if  $(X, \|\cdot\|_X)$  is not a Hilbert space, then neither left nor right  $D_{\Psi_{\varphi_{1,1/2}}}$ -projections coincide with metric projections (cf. [14, p. 39] for a simple example). If  $(X, \|\cdot\|_X)$  is reflexive, Gateaux differentiable, strictly convex, and  $x \in X$ , then: left  $D_{\Psi_{\varphi_{1,1/2}}}$ -projections  $\mathfrak{P}_{K}^{D_{\Psi_{\varphi_{1,1/2}}}}(x)$ onto closed convex sets K are characterised as  $z \in X$  satisfying variational inequality [10, Prop. 7.c

$$[[z - y, j(x) - j(z)]]_{X \times X^*} \ge 0 \ \forall y \in K,$$
 (126)

which is a special case of Equation (53); if  $K\subseteq X$  is left  $D_{\Psi_{\varphi_{1,1/2}}}$ -Chebyshëv then K is convex iff it is weakly closed [237, Cor. 4.2] (cf. Corollary 3.14). See [8, 10, 13] for further properties of left  $D_{\Psi_{\varphi_{1,1/2}}}$ -projections in this case.

(viii) It is quite noticeable that Proposition 3.11 and Corollary 3.13.(iii) provide jointly all three key convexity properties of  $\Psi_{\varphi}$  (i.e.  $\Psi_{\varphi}$  being supercoercive, totally convex, and Euler-Legendre) without assuming reflexivity of  $(X, \|\cdot\|_X)$ . Additionally, the sum of Proposition 3.11 and Corollary 3.13.(iii) can be considered as a far generalisation of Example 2.2.(vi) from  $\Psi = \Psi_{\varphi_{1,1/2}}$  and  $X = \mathbb{R}^n$  to  $\Psi = \Psi_{\varphi}$  for any gauge  $\varphi$  and any Gateaux differentiable, strictly convex, locally

uniformly convex Banach space  $(X, \|\cdot\|_X)$ . The equation (49) is recovered from (125) by setting  $(X, \|\cdot\|_X) = (L_{1/\gamma}(\mathcal{X}, \mu), \|\cdot\|_{1/\gamma})$  with purely atomic finite  $(\mathcal{X}, \mu)$ , and applying the formula for j on  $(L_{1/\gamma}(\mathcal{X}, \mu), \|\cdot\|_{1/\gamma})$ , which reads [248, p. 132]  $j(x) = \|x\|_{1/\gamma}^{2-1/\gamma} |x|^{1/\gamma-1} \operatorname{sgn}(x)$ .

(ix.a) If  $\alpha = 1$ ,  $\beta = \frac{1}{2}$ , and  $(X, \|\cdot\|_X)$  is a Hilbert space  $(\mathcal{H}, \langle \cdot, \cdot \rangle_{\mathcal{H}})$ , then  $(\Psi_{\varphi_{1,1/2}})^{\mathbf{F}} = \Psi_{\varphi_{1,1/2}} = \frac{1}{2} \|\cdot\|_{\mathcal{H}}^2$ ,  $\mathfrak{D}^{\mathbf{G}} \Psi_{\varphi_{1,1/2}} = \mathrm{id}_{\mathcal{H}}$  with  $\mathfrak{D}^{\mathbf{G}} \Psi_{\varphi_{1,1/2}}(y)(x) = \langle x, y \rangle_{\mathcal{H}}$ , and (125) turns into [65, p. 1021] [66, §2.1]

$$D_{\Psi_{\varphi_{1,1/2}}}(x,y) = \frac{1}{2} \|x\|_{\mathcal{H}}^2 + \frac{1}{2} \|y\|_{\mathcal{H}}^2 - \langle x, y \rangle_{\mathcal{H}} = \frac{1}{2} \|x - y\|_{\mathcal{H}}^2 \ \forall x, y \in \mathcal{H}.$$
 (127)

In consequence, Chebyshëv, left  $D_{\Psi_{\varphi_{1,1/2}}}$ -Chebyshëv, and right  $D_{\Psi_{\varphi_{1,1/2}}}$ -Chebyshëv subsets of  $\mathcal{H}$  coincide, with

$$\overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi\varphi_{1,1/2}}}(y) = \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi\varphi_{1,1/2}}}(y) = \mathfrak{P}_{K}^{d_{\|\cdot\|_{\mathcal{H}}}}(y) \ \forall y \in \mathcal{H} \ \forall \text{ Chebyshëv } K \subseteq \mathcal{H}.$$
 (128)

In particular, for any convex closed  $K \subseteq \mathcal{H}$ , the metric projection  $\mathfrak{P}_K^{d_{\parallel} \cdot \parallel_{\mathcal{H}}}(y)$  is characterised as a map  $T: \mathcal{H} \to K$  satisfying [24, p. 87]

$$\langle y - T(x), x - T(x) \rangle_{\mathcal{H}} \le 0 \ \forall (x, y) \in \mathcal{H} \times K.$$
 (129)

If K is affine, then the generalised pythagorean equation (57) turns into

$$\|x - y\|_{\mathcal{H}}^2 = \|x - \mathfrak{P}_K^{d_{\|\cdot\|_{\mathcal{H}}}}(y)\|_{\mathcal{H}}^2 + \|\mathfrak{P}_K^{d_{\|\cdot\|_{\mathcal{H}}}}(y) - y\|_{\mathcal{H}}^2 \quad \forall (x, y) \in K \times \mathcal{H}$$

$$(130)$$

(with  $\mathfrak{P}_K^{d_{\|\cdot\|_{\mathcal{H}}}}$  given by the bounded linear projection operator  $P_K:\mathcal{H}\to K$  if K is a linear subspace of  $\mathcal{H}$ ), while the generalised cosine equation (26) turns into

$$\|x - z\|_{\mathcal{H}}^2 = \|x - y\|_{\mathcal{H}}^2 + \|y - z\|_{\mathcal{H}}^2 - 2\langle x - y, z - y\rangle_{\mathcal{H}} \ \forall x, y \in \mathcal{H}$$
 (131)

(which, for  $\mathcal{H} = \mathbb{R}^2$  with  $\langle x, y \rangle_{\mathcal{H}} = \sum_{i=1}^2 x_i y_i$ , gives the cartesian version of a planar cosine theorem of al-Kāshānī [6]<sup>26</sup>). On the other hand, left and right strongly quasinonexpansive operators with respect to  $\Psi_{\varphi_{1,1/2}}$  on  $\mathcal{H}$  do not coincide, in general, with the strongly  $\|\cdot\|_{\mathcal{H}}$ -nonexpansive operators of [77, p. 459], although for  $\mathcal{H} = \mathbb{R}^n$  the latter are the subset of the former [242, Rem. 3].

(ix.b) While there is no general notion of an angle between two elements of a general Banach space, the relationship between (26) and (131) allows us to introduce a  $\Psi$ -angle between nonzero vectors  $x - y, z - y \in X$ , for any reflexive and Gateaux differentiable Banach space  $(X, \|\cdot\|_X)$ :

$$\measuredangle_{\Psi}(x - y, z - y) := \arccos\left(\frac{\left[\left[x - y, \mathfrak{D}^{G}\Psi(z) - \mathfrak{D}^{G}\Psi(y)\right]\right]_{X \times X^{*}}}{2\|x - y\|_{X}\|z - y\|_{X}}\right).$$
(132)

(x) Not much is known so far about weak sequential continuity of  $j_{\varphi} = \mathfrak{D}^{G}\Psi_{\varphi}$  for arbitrary gauge  $\varphi$  and arbitrary Banach spaces. It is known to hold for  $\varphi_{1,\beta}(t) = t^{1/\beta-1}$  on sequence spaces  $(l_{1/\beta}, \|\cdot\|_{1/\beta})$  with  $\beta \in ]0,1[$  [73, Lemm. 5], and on arbitrary infinite-dimensional Hilbert spaces iff  $\beta = \frac{1}{2}$  [348, Prop. 3.3]. On the other hand, it is known that  $j_{\varphi}$  is not weakly sequentially continuous for arbitrary  $\varphi$  on  $(L_{1/\gamma}(\mathcal{X},\mu),\|\cdot\|_{1/\gamma})$  spaces with  $\gamma \in ]0,1[\setminus \{\frac{1}{2}\}$  and nonatomic finite  $(\mathcal{X},\mu)$  [269, Lemm. 3, §5] (cf. [73, p. 268] for  $\gamma = \frac{1}{4}$  case), and for  $\varphi(t) = t$  on  $(l_{1/\gamma},\|\cdot\|_{1/\gamma})$  spaces for  $p \in ]0,1[\setminus \{\frac{1}{2}\}$  [348, Prop. 3.2]. These are quite severe limitations, appearing already at the range of elementary model spaces. By this reason, in Propositions 3.4.(iv) and 3.24 we have omitted the case a) of Proposition 2.16.(iv) in favour of case b), which is much better behaved geometrically, and (as we will show in Section 4) admits a direct application to a range of noncommutative model spaces. In the broader perspective, dependence of weak sequential

<sup>&</sup>lt;sup>26</sup>More precisely, al-Kāshānī states  $c = \sqrt{(a\sin\theta)^2 + (b - a\cos\theta)^2}$ , that is equivalent to  $c^2 = a^2 + b^2 - 2ab\cos\theta$  via  $(\sin\theta)^2 + (\cos\theta)^2 = 1$ . Cf. p. 143 of Russ. transl. or p. 31 of Vol. 2 of Engl. transl.

continuity of  $\mathfrak{D}^G\Psi_{\varphi}$  on the specific choice of  $\varphi$  makes it a property of a different character from all other properties of  $\Psi_{\varphi}$  and  $\mathfrak{D}^G\Psi_{\varphi}$  used in this paper for the case I–IV models. So, even if it would be available for a larger class of models, relying on it would break the invariance of our framework with respect to the choice of a gauge, and this would be a structurally undesirable feature. Nevertheless, in face of the relationships expressed in Proposition 2.25, it is tempting to ask: what kind of differentiability property of  $\Psi_{\varphi}$  (and of  $(X, \|\cdot\|_X)$ ) is equivalent to weak sequential continuity of  $j_{\varphi}$ ?

- (xi) Corollary 3.31 provides a generalisation of the duality between  $\frac{1}{\gamma}$ -uniformly convex and  $\frac{1}{1-\gamma}$ -uniformly Fréchet differentiable Banach spaces,  $\gamma:=\frac{1}{r}\in ]0,1[$ , as exhibited in Proposition 2.25.(vii)–(viii) (and originally stated in [226, p. 63 (Vol. 2)]; the case  $\gamma=\frac{1}{2}$  goes back to [225, Lemm. 4]). Proposition 2.25.(viii).b) leads us to ask: is it possible to identify a specific type of uniform continuity of  $j_{\varphi}$  which would be equivalent to  $\varphi$ -uniform Fréchet differentiability of  $(X, \|\cdot\|_X)$ ? And, if yes, then is it possible to use it to generalise Proposition 3.29 by replacing  $\varphi_{1,\beta}$  by any gauge  $\varphi$ , together with replacing  $\frac{1}{\beta}$ -uniform convexity (resp.,  $\frac{1}{\beta}$ -uniform Fréchet differentiability)? An analogous question of an extension rises with respect to [320, Thm. 5] (=[192, Thm. 1, Thm. 2]), which states that r-uniform convexity (resp., r-uniform Fréchet differentiability) of a Banach space  $(X, \|\cdot\|_X)$  is equivalent with  $(X, \|\cdot\|_X)$  having a strong type (resp., strong cotype) r, as defined in [320, Def. 2] (=[192, Rem. 2.(iii), Rem. 3.(iii)]). Is it possible to define the corresponding notions of a strong  $\varphi$ -type (resp., strong  $\varphi$ -cotype), which would be equivalent to  $\varphi$ -uniform convexity (resp.,  $\varphi$ -uniform Fréchet differentiability)?
- (xii) The special case of Proposition 3.32, for  $\varphi(t) = t$  and  $\overleftarrow{\mathfrak{P}}_{K_1}^{D_{\Psi_{\varphi}}}$ , has been obtained in [11, Thm. 2.4] (cf. [12, Thm. 2.13] for its nontrivial consequence). For  $\varphi(t) = t$  and  $(X, \|\cdot\|_X)$  given by a Hilbert space, this result has been obtained in [255, Prop. 1].
- (xiii) If  $(X, \|\cdot\|_X)$  is reflexive and Gateaux differentiable, and  $\varphi$  is a gauge, then  $\forall x, y \in X$

$$D_{\Psi_{\varphi}}(x,y) = \begin{cases} \Psi_{\varphi}(x) + (\Psi_{\varphi})^{\mathbf{F}}(j_{\varphi}(y)) - \langle \langle x, y \rangle \rangle_{\varphi} & : y \neq 0 \\ \Psi_{\varphi}(x) & : y = 0, \end{cases}$$
(133)

where

$$\langle\!\langle \cdot, x \rangle\!\rangle_{\varphi} := \begin{cases} \frac{\varphi(\|x\|_X)}{\|x\|_X} \left\langle\!\langle \cdot, x \rangle\!\rangle & : x \neq 0 \\ 0 & : x = 0, \end{cases}$$
 (134)

and  $\langle\!\langle x,y\rangle\!\rangle := (j(y))(x)$ . For any Banach space  $(X,\|\cdot\|_X)$ , if  $x,y\in X$ , then x is said to be **orthogonal** to y iff  $\|x+\lambda y\|_X \geq \|x\|_X \ \forall \lambda\in\mathbb{R}$  [52, p. 169]. If  $(X,\|\cdot\|_X)$  is Gateaux differentiable, then x is orthogonal to y iff (j(y))(x)=0 (cf., e.g., [142, Prop. 1.4.4]). Hence,  $\langle\!\langle \cdot\,,\cdot\rangle\!\rangle_{\varphi}$  can be seen as a generalised form of orthogonality. (The notation  $\langle\!\langle \cdot\,,\cdot\rangle\rangle\!\rangle$  refers to Lumer's semi-inner product [234, Def. 1], which in the case of Gateaux differentiable  $(X,\|\cdot\|_X)$  is given uniquely by  $(j(\cdot))(\cdot)$ .) In particular, for  $\Psi=\Psi_{\varphi}$ , the formula (132) turns into

$$\measuredangle_{\Psi_{\varphi}}(x-y,z-y) := \arccos\left(\frac{\langle\langle x-y,z\rangle\rangle_{\varphi} - \langle\langle x-y,y\rangle\rangle_{\varphi}}{2\|x-y\|_X\|z-y\|_X}\right).$$
(135)

(xiv) Corollary 3.19 provides an alternative proof of Corollary 3.13.(i). Proposition 3.11 (resp., 3.12; 3.15) is a special case of Proposition 3.20.(iii) (resp., 3.21; 3.22). We have separated these propositions in order to illustrate the differences showing up under generalisation from gauges to quasigauges. In principle, provided a quasigauge generalisation of Propositions 2.25.(iv) and 2.25.(xii), one could use Propositions 3.3 and 3.4, combined with Propositions 2.28.(iii)–(iv), to obtain a quasigauge generalisation of Propositions 3.23 and 3.24. (Even a quasigauge analogue of Proposition 2.25.(xii) would suffice, although in this case the corresponding generalisation of Proposition 3.23 would be less general, using local uniform convexity of  $(X, \|\cdot\|_X)$  and  $(X, \|\cdot\|_X)^*$  instead of their Fréchet differentiability.) For our current purposes it is sufficient to compare Proposition 3.15 with Proposition 3.22: already at this level, there is a noticeable difference between conditions required for a quasigauge for either left or right pythagoreanity of  $D_{\Psi_{\varphi}}$ . Furthermore, in the left case there are three inequivalent conditions available, while in the right

case there are six inequivalent conditions. An inspection of the proofs leading to this result, together with a look at Propositions 2.28.(iii)–(iv), shows that the conditions imposed on  $\varphi$  in the quasigauge analogues of Propositions 3.23 and 3.24 will not be the same as in Proposition 3.22. Thus, while there is no a priori constraints on the gauge functions used in the Propositions 3.15, 3.23, and 3.24, their quasigauge analogues introduce a substantial split of the assumptions on  $\varphi$  used in each of the corresponding propositions. So, while the properties of case I–IV models are independent of the choice of a gauge, they are sensitive to the choice of a quasigauge.

- (xv) In principle, due to Lemma 3.16.(i), given a quasigauge  $\varphi$ , one can use  $(\lim_{s\to^+t}\varphi(s))^{\vee}$  (resp.,  $(\lim_{s\to^-t}\varphi(s))^{\wedge}$ ) instead of  $\varphi^{\vee}$  (resp.,  $\varphi^{\wedge}$ ), relying on (103) and Lemma 3.18.(i) instead of (104) (resp., (105)) and (108) (resp., (109)) in Propositions 3.20.(iii), 3.21, and 3.22. However, while this would make these propositions a bit more general, it would also make them less readable.
- (xvi) If  $\operatorname{efd}(j_{\varphi}) = \operatorname{int}(\operatorname{efd}(j_{\varphi})) = \operatorname{efd}(\Psi_{\varphi}) = \operatorname{int}(\operatorname{efd}(\Psi_{\varphi})) = \operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X))$ , then the assumptions (116) simplify, since their first and third line become obsolete. However, in a general case, we know only that  $\operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X)) \subseteq \operatorname{efd}(\Psi_{\varphi}) \subseteq \operatorname{cl}(\operatorname{int}(\sup(\operatorname{efd}(\varphi))B(X, \|\cdot\|_X)))$  [359, p. 369].
- (xvii) The result in Proposition 3.29.(i) was obtained earlier, by a different method, in [310, Prop. 6.27.(a)]. By [310, Eqn. (6.100)], under conditions on  $(X, \|\cdot\|_X)$  given in 3.29.(i),  $\exists \lambda > 0 \ \forall x, y \in X$

$$\left\| \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}(x) - \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}(y) \right\|_{X} \le \lambda \left( \max \left\{ \left\| \mathfrak{P}_{K}^{d_{\|\cdot\|_{X}}}(0) \right\|_{X}, \|x\|_{X}, \|y\|_{X} \right\} \left\| j_{\varphi_{1,\beta}}(x) - j_{\varphi_{1,\beta}}(y) \right\|_{X} \right)^{\beta}. \tag{136}$$

Assuming boundedness of K, boundedness of domain  $Q \subseteq X$  of  $\mathfrak{P}_K^{D_{\Psi_{\varphi_{1,\beta}}}}$ , r-uniform Fréchet differentiability of  $(X, \|\cdot\|_X)$ , and using Proposition 2.25.(viii).c), we get

$$\exists \lambda > 0 \ \forall x, y \in Q \ \left\| \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}(x) - \overleftarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}(y) \right\|_{X} \le \lambda \|x - y\|_{X}^{\beta(r-1)}. \tag{137}$$

Hence, for bounded K, and under all assumptions of Proposition 3.29.(i), this gives  $\beta(r-1)$ -Lipschitz-Hölder continuity of  $\mathfrak{P}_K^{D_{\Psi_{\varphi_{1,\beta}}}}$  on bounded subsets of X. In comparison with Proposition 3.29.(ii), this conclusion is weaker regarding the value of the exponent of Lipschitz-Hölder continuity (since  $1 \geq \frac{\beta}{1-\beta}(r-1) > \beta(r-1)$ ) and regarding the assumptions on its domain (limitation to bounded subsets of X), while assuming more (boundedness of K). An analogue of a proof of Proposition 3.29.(iv), using

- a) given the convex and bounded subset U (resp., W) of a Banach space  $(X_1, \|\cdot\|_{X_1})$  (resp.,  $(X_2, \|\cdot\|_{X_2})$ ), and a Banach space  $(X_3, \|\cdot\|_{X_3})$ , if  $f: U \to X_2$  is s-Lipschitz-Hölder continuous,  $g: W \to X_3$  is  $\lambda$ -Lipschitz-Hölder continuous,  $f(U) \subseteq W$ , and  $s, \lambda \in ]0,1]$ , then  $g \circ f$  is  $s\lambda$ -Lipschitz-Hölder continuous [120, Thm. 4.3, Prop. 5.2],
- b) by definition of  $j_{\varphi}$ , it maps bounded sets to bounded sets (cf. the proof of Proposition 3.11), gives  $\frac{(1-\beta)^2}{\beta}(r-1)^2$ -Lipschitz-Hölder continuity of  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi\varphi_{1,\beta}}}$  on bounded and convex subsets of X, under the assumptions of Proposition 3.29.(iv), equipped with an additional requirement that  $j_{\varphi_{1,\beta}}(K)$  is bounded. This conclusion is weaker than Proposition 3.29.(iv).
- (xviii) The continuity results in Proposition 3.23 cannot be improved using Proposition 3.26, since  $\lim_{\|x\|_{Y}\to\infty} \iota_{K}(x) \neq \infty$ .

#### 3.3 $D_{\ell,\Psi}$

**Definition 3.34.** Given Banach spaces  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$ ,  $Z \subseteq Y$ ,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ , let  $\ell : Z \to \ell(Z) \subseteq X$  be a bijection such that  $\ell(Z) \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \varnothing$ . Then

$$D_{\ell \Psi}(\phi, \psi) := D_{\Psi}(\ell(\phi), \ell(\psi)) \ \forall (\phi, \psi) \in Z \times Z \tag{138}$$

will be called an extended Vainberg-Brègman functional.

**Definition 3.35.** Given Banach spaces  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$ ,  $\varnothing \neq Z \subseteq Y$ ,  $\varnothing \neq K \subseteq X$ , a bijection  $\ell: Z \to \ell(Z) \subseteq X$  with  $K \subseteq \ell(Z)$ , and a function  $T: K \to \ell(Z)$ , the function  $T^{\ell} := \ell^{-1} \circ T \circ \ell : \ell^{-1}(K) \to Z$  will be called an  $\ell$ -operator.

**Definition 3.36.** Under assumptions on  $(\ell, \Psi)$  as in Definition 3.34, and with  $\emptyset \neq C \subseteq Z$ ,

(i) C will be called **left** (resp., **right**)  $D_{\ell,\Psi}$ -**Chebyshëv** iff  $\ell(C)$  is left (resp., right)  $D_{\Psi}$ -Chebyshëv, with the corresponding **left** (resp., **right**)  $D_{\ell,\Psi}$ -**projections** given by

$$\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\phi) := \ell^{-1} \circ \overleftarrow{\mathfrak{P}}_{\ell(C)}^{D_{\Psi}} \circ \ell(\phi) \ \forall \phi \in \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$$
 (139)

$$(resp., \overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\phi) := \ell^{-1} \circ \overrightarrow{\mathfrak{P}}_{\ell(C)}^{D_{\Psi}} \circ \ell(\phi) \ \forall \phi \in \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z)) \ ); \tag{140}$$

- (ii)  $D_{\ell,\Psi}$  will be called **left** (resp., **right**) **pythagorean** on C iff  $D_{\Psi}$  is left (resp., right) pythagorean on  $\ell(C)$ ;
- (iii) C will be called  $\ell$ -convex (resp.,  $\ell$ -closed;  $\ell$ -affine;  $\ell$ -bounded;  $\mathfrak{D}^G\Psi \circ \ell$ -convex;  $\mathfrak{D}^G\Psi \circ \ell$ -closed;  $\mathfrak{D}^G\Psi \circ \ell$ -affine) iff  $\ell(C)$  is convex (resp., closed; affine; bounded;  $\mathfrak{D}^G\Psi$ -convex;  $\mathfrak{D}^G\Psi$ -closed;  $\mathfrak{D}^G\Psi$ -affine);
- (iv)  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$ ) will be called **zone consistent** iff  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  and  $\overleftarrow{\mathfrak{P}}_{\ell(C)}^{D_{\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{\ell(C)}^{D_{\Psi}}$ ) is zone consistent;
- (v)  $\Psi \circ \ell : Z \to ]-\infty,\infty]$  and  $\Psi^{\mathbf{F}} \circ \mathfrak{D}^{\mathbf{G}} \Psi \circ \ell : \ell^{-|(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z)) \to ]-\infty,\infty]}$  will be called  $(\ell,\Psi)$ -potentials;
- (vi) the topology on Z induced by  $\ell$  (resp.,  $\mathfrak{D}^{G}\Psi \circ \ell$ ) from the norm topology of  $(X, \|\cdot\|_X)$  (resp.,  $(X^{\star}, \|\cdot\|_{X^{\star}})$ ) will be called  $\ell$ -topology (resp.,  $\mathfrak{D}^{G}\Psi \circ \ell$ -topology);
- (vii) An  $\ell$ -operator  $T^{\ell}: C \to \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$  will be called **left** (resp., **right**) **strongly quasi nonexpansive** with respect to  $(\ell, \Psi)$  and C iff  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  and T is left (resp., right) strongly quasinonexpansive with respect to  $\Psi$  and  $\ell(C)$ ; the set of all  $\ell$ -operators which are left (resp., right) strongly quasinonexpansive with respect to  $(\ell, \Psi)$  and C will be denoted  $\operatorname{LSQ}(\ell, \Psi, C)$  (resp.,  $\operatorname{RSQ}(\ell, \Psi, C)$ );
- (viii) the set  $LSQ(\ell, \Psi, C)$  (resp.,  $RSQ(\ell, \Psi, C)$ ) will be called **composable** iff  $LSQ(\Psi, \ell(C))$  (resp.,  $RSQ(\Psi, \ell(C))$ ) is composable;
- (ix)  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$ ) will be called **adapted** iff  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\Psi}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\Psi}}$ ) is adapted; (x) an  $\ell$ -operator  $T^{\ell}: C \to \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$  will be called **completely nonexpansive** with
- (x) an  $\ell$ -operator  $T^{\ell}: C \to \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$  will be called **completely nonexpansive** with respect to  $(\ell, \Psi)$  and C iff  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$  and T is completely nonexpansive with respect to  $\Psi$  and  $\ell(C)$ ; the set of all  $\ell$ -operators which are completely nonexpansive with respect to  $(\ell, \Psi)$  and C will be denoted  $\operatorname{CN}(\ell, \Psi, C)$ .

Corollary 3.37. If  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  are Banach spaces,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ ,  $\emptyset \neq C \subseteq Z \subseteq Y$ ,  $\ell: Z \to \ell(Z) \subseteq X$  is a bijection such that  $\ell(Z) \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$ , then:

- (i) if  $D_{\Psi}$  is an information on  $\ell(Z)$ , then  $D_{\ell,\Psi}$  is an information on Z;
- (ii) C is  $\ell$ -closed iff it is closed in the topology induced by  $\ell$  from the norm topology of  $(X, \|\cdot\|_X)$ ;
- (iii) if  $(X, \|\cdot\|_X)$  reflexive, C is  $\ell$ -closed and  $\ell$ -convex, then:
  - 1) if any of the following (generally, inequivalent) conditions holds,
    - a)  $\Psi$  is totally convex on  $\operatorname{efd}(\Psi)$ ,  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ; or
    - b)  $\Psi$  is strictly convex on  $\operatorname{efd}(\Psi)$  and supercoercive,  $\ell(C) \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \emptyset$ ;
    - c)  $\Psi$  is Euler-Legendre,  $\ell(C) \cap \operatorname{int}(\operatorname{efd}(\Psi)) \neq \varnothing$ ;

then C is left  $D_{\ell,\Psi}$ -Chebyshëv and  $D_{\ell,\Psi}$  is left pythagorean on C;

- 2) if (condition c) holds) or (condition a) or condition b) holds, and  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ), then  $\overline{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  is zone consistent;
- 3) if any of a), b), c) holds, then  $D_{\ell,\Psi}$  is an information on Z;
- 4) if c) holds, then  $D_{\mathfrak{D}^{G}\Psi\circ\ell.\Psi^{\mathbf{F}}}$  is an information on Z;
- 5) if any of a), b), c) holds, and C is  $\ell$ -affine, then

$$D_{\ell,\Psi}(\phi, \overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\psi)) + D_{\ell,\Psi}(\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\psi), \psi) = D_{\ell,\Psi}(\phi, \psi) \ \forall (\phi, y) \in C \times \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z)). \tag{141}$$

6) if  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\Psi$  is Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi))$ , totally convex on  $\operatorname{efd}(\Psi)$ , and supercoercive, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell,\Psi}}$  is  $\ell$ -topology-to- $\ell$ -topology continuous on  $\ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$ , while  $\operatorname{inf}_{\phi \in K}\{D_{\ell,\Psi}(\phi,\cdot)\}$  is continuous in  $\ell$ -topology on  $\ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z))$ .

- (iv) if  $(X, \|\cdot\|_{Y})$  is reflexive, C is  $\mathfrak{D}^{G}\Psi \circ \ell$ -closed and  $\mathfrak{D}^{G}\Psi \circ \ell$ -convex,  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi)), \Psi^{\mathbf{F}}$  is Gateaux differentiable on  $\varnothing \neq \mathfrak{D}^{G}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , then:
  - 1) if any of the following (generally, inequivalent) conditions holds,
    - a)  $\Psi^{\mathbf{F}}$  is totally convex on efd( $\Psi^{\mathbf{F}}$ ); or
    - b)  $\Psi^{\mathbf{F}}$  is strictly convex on efd( $\Psi^{\mathbf{F}}$ ) and supercoercive; or
    - c)  $\Psi^{\mathbf{F}}$  is Euler-Legendre;

then C is right  $D_{\ell,\Psi}$ -Chebyshëv and  $D_{\ell,\Psi}$  is right pythagorean on C;

- 2) if any of a), b), c) above holds, then  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  is zone consistent; 3) if c) holds, then  $D_{\ell,\Psi}$  and  $D_{\mathfrak{D}^{G}\Psi\circ\ell,\Psi^{\mathbf{F}}}$  are informations on C;
- 4) if any of a), b), c) holds, and C is  $\mathfrak{D}^G\Psi \circ \ell$ -affine, then

$$D_{\ell,\Psi}(\phi,\psi) = D_{\ell,\Psi}(\phi, \overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\phi)) + D_{\ell,\Psi}(\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}(\phi),\psi) \quad \forall (\phi,\psi) \in \ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)) \cap \ell(Z)) \times C;$$
(142)

- 5) if  $\Psi^{\mathbf{F}}$  is totally convex on  $\operatorname{efd}(\Psi^{\mathbf{F}})$ , Fréchet differentiable on  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , and supercoercive, then  $\overrightarrow{\mathfrak{P}}_C^{D_{\ell,\Psi}}$  is  $\ell$ -topology-to- $\ell$ -topology continuous on  $\ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi))\cap \ell(Z))$ .
- (v) if  $\ell$  is a norm-to-norm homeomorphism, then:
  - 1)  $\ell$ -closed sets in  $(Y, \|\cdot\|_Y)$  coincide with closed sets;
  - 2) result in (iii).6) is strengthened to norm-to-norm continuity of  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  onto closed  $\ell$ -convex C, and continuity of  $\inf_{\phi \in C} \{D_{\ell,\Psi}(\phi, \cdot)\}\$  in the norm topology;
  - 3) if  $\Psi$  is Fréchet differentiable, then  $\mathfrak{D}^{G}\Psi \circ \ell$ -closed sets in  $(Y, \|\cdot\|_{Y})$  coincide with closed sets;
  - 4) if  $\Psi$  is Fréchet differentiable, then the result in (iv).5) is strengthened to norm-to-norm
- continuity of  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  onto  $\mathfrak{D}^{G}\Psi \circ \ell$ -convex set C, closed in the norm topology of  $(Y, \|\cdot\|_{Y})$ . (vi) if  $(X, \|\cdot\|_{X})$  is reflexive,  $\Psi: X \to \mathbb{R}$  is uniformly Fréchet differentiable on bounded subsets of X, and  $\Psi^{\mathbf{F}}$  is supercoercive, then:
  - 1) if any of the following (generally, inequivalent) condition holds,
    - a)  $\Psi$  is totally convex on X: or
    - b)  $\Psi$  is totally convex on bounded subsets of X and supercoercive; then  $LSQ(\ell, \Psi, C)$  is composable;
  - 2) if any of the following (generally, inequivalent) condition holds,
    - a)  $\Psi$  is totally convex on bounded subsets of X; or
    - b)  $\Psi$  is Euler-Legendre and supercoercive,  $\Psi^{\mathbf{F}}$  is (totally convex and uniformly Fréchet differentiable) on bounded subsets of  $\operatorname{efd}(\Psi^{\mathbf{F}}) = X^{\star}$ ;

then  $RSQ(\ell, \Psi, C)$  is composable;

- 3) if  $\Psi$  is Euler-Legendre, and C is  $\ell$ -convex and  $\ell$ -closed, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell,\Psi}}$  is adapted; 4) if  $\Psi$  is supercoercive and Euler-Legendre, and  $\Psi^{\mathbf{F}}$  is uniformly Fréchet differentiable on
- bounded subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})) \neq \varnothing$ , then  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  is adapted for any  $\mathfrak{D}^{G}\Psi \circ \ell$ -convex  $\mathfrak{D}^{G}\Psi \circ \ell$  $closed\ C.$

*Proof.* Follows from Definition 3.36 applied to Propositions 3.1, 3.3, and 3.4.

Corollary 3.38. Let  $(Y, \|\cdot\|_Y)$  be a Banach space,  $(X, \|\cdot\|_X)$  a reflexive, Gateaux differentiable, strictly convex Banach space,  $\varphi$  a gauge,  $\varnothing \neq C \subseteq Z \subseteq Y$ ,  $\ell: Z \to \ell(Z) \subseteq X$  a bijection. Then:

- (i)  $D_{\ell,\Psi_{\varphi}}$  and  $D_{\mathfrak{D}^{G}\Psi_{\varphi}\circ\ell,\Psi_{\varphi}^{\mathbf{F}}}$  are informations on Z;
- (ii) if C is  $\ell$ -convex and  $\check{\ell}$ -closed, then C is left  $D_{\ell,\Psi_{\omega}}$ -Chebyshëv,  $D_{\ell,\Psi_{\omega}}$  is left pythagorean on C, and  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi_{\varphi}}}$  are zone consistent; (iii) if C is  $j_{\varphi} \circ \ell$ -convex and  $j_{\varphi} \circ \ell$ -closed, then C is right  $D_{\ell,\Psi_{\varphi}}$ -Chebyshëv,  $D_{\ell,\Psi_{\varphi}}$  is right pythagorean
- on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi_{\varphi}}}$  are zone consistent;
- (iv) if  $(X, \|\cdot\|_X)$  is Fréchet differentiable and has the Radon-Riesz-Shmul'yan property, then:
  - 1) if C is  $\ell$ -convex and  $\ell$ -closed, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell,\Psi_{\varphi}}}$  is  $\ell$ -topology-to- $\ell$ -topology continuous on Z, while  $\inf_{\phi \in C} \{D_{\ell,\Psi_{\omega}}(\phi, \cdot)\}\ is\ continuous\ in\ \ell\text{-topology}\ on\ Z;$
  - 2) if C is  $j_{\varphi} \circ \ell$ -convex and  $j_{\varphi} \circ \ell$ -closed, then  $\ell$ -topology coincides with  $\mathfrak{D}^{G}\Psi_{\varphi} \circ \ell$ -topology (so, C is  $\ell$ -closed), and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi_{\varphi}}}$  is  $\ell$ -topology-to- $\ell$ -topology continuous;

- (v) if  $\ell$  is norm-to-norm homeomorphism, then  $\ell$ -topological closure and continuity in 2), 4).(i), and 4).(ii) coincide, respectively, with closure and continuity in norm topology of  $(Y, ||\cdot||_Y)$ ;
- (vi) if  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable and strictly convex, and C is  $\ell$ -convex and  $\ell$ -closed, then  $\mathfrak{F}_C^{D_{\ell,\Psi_{\varphi}}}$  is adapted;
- (vii) if  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable, strictly convex, and has the Radon–Riesz–Shmul'yan property, then the sets  $LSQ(\ell, \Psi_{\varphi}, C)$  and  $RSQ(\ell, \Psi_{\varphi}, C)$  are composable;
- (viii) if  $(X, \|\cdot\|_X)$  is uniformly Fréchet differentiable and uniformly convex, and if C is  $j_{\varphi} \circ \ell$ -convex  $j_{\varphi} \circ \ell$ -closed, then  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  is adapted.

*Proof.* Follows from Definition 3.36 applied to Propositions 3.12, 3.15, 3.23, 3.24.

# 3.4 Categories of $D_{\ell,\Psi}$ -projections and strongly $D_{\ell,\Psi}$ -quasinonexpansive maps

**Definition 3.39.** Let  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  be Banach spaces, let  $(X, \|\cdot\|_X)$  be reflexive,  $\emptyset \neq W \subseteq Z \subseteq Y$ ,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$ ,  $\ell : Z \to \operatorname{int}(\operatorname{efd}(\Psi))$  be a bijection. Consider two conditions:

- (L)  $\Psi$  is totally convex on efd( $\Psi$ ) or Euler-Legendre or (strictly convex on efd( $\Psi$ ) and supercoercive);
- (R)  $\Psi^{\mathbf{F}}$  is Gateaux differentiable on  $\varnothing \neq \mathfrak{D}^{\mathbf{G}}\Psi(\operatorname{int}(\operatorname{efd}(\Psi))) \subseteq \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$  and (totally convex on  $\operatorname{efd}(\Psi^{\mathbf{F}})$  or Euler–Legendre or (strictly convex on  $\operatorname{efd}(\Psi)$  and supercoercive)). Then:
  - (i) if condition (L) holds, then  $1\text{Cvx}(\ell, \Psi, W)$  is a category with: objects given by  $\ell$ -closed  $\ell$ -convex subsets of W, including  $\varnothing$ ; morphisms given by left  $D_{\ell,\Psi}$ -projections onto  $\ell$ -closed  $\ell$ -convex subsets of these subsets (i.e.  $\text{Hom}_{1\text{Cvx}(\ell,\Psi,W)}(\cdot,C)$  consists of  $\overleftarrow{\mathfrak{P}}_Q^{D_{\ell,\Psi}}$  with Q varying over all  $\ell$ -closed  $\ell$ -convex subsets of C), including  $\varnothing$  (resulting in empty arrows,  $\lceil \varnothing \rceil \in \text{Hom}_{1\text{Cvx}(\ell,\Psi,W)}(C_1,C_2)$ ); identity morphisms given by  $\overleftarrow{\mathfrak{P}}_C^{D_\Psi}(C) = C$ ; composition of morphisms given by

$$\overleftarrow{\mathfrak{P}}_{C_2}^{D_{\ell,\Psi}} \diamond \overleftarrow{\mathfrak{P}}_{C_1}^{D_{\ell,\Psi}} := \overleftarrow{\mathfrak{P}}_{C_2 \cap C_1}^{D_{\ell,\Psi}}, \tag{143}$$

with composition of any morphism with empty arrow resulting in an empty arrow;

- (ii) if condition (L) holds, then  $\mathtt{lAff}(\ell, \Psi, W)$  is a subcategory of  $\mathtt{lCvx}(\ell, \Psi, W)$  obtained by restriction from  $\ell$ -closed  $\ell$ -convex to  $\ell$ -closed  $\ell$ -affine subsets of W;
- (iii) if condition (L) holds, then  $\mathtt{lCvx}\subseteq(\ell, \Psi, W)$  (resp.,  $\mathtt{lAff}\subseteq(\ell, \Psi, W)$ ) is a subcategory of  $\mathtt{lCvx}(\ell, \Psi, W)$  (resp.,  $\mathtt{lAff}(\ell, \Psi, W)$ ) obtained by restriction of composition (143) by the condition  $C_2\subseteq C_1$  (so the composition of morphisms not satisfying this condition results in  $\square \varnothing \square$ );
- (iv) if condition (L) holds, then  $\mathtt{lCvx}(\ell, \Psi)$  (resp.,  $\mathtt{lAff}(\ell, \Psi)$ ;  $\mathtt{lCvx}^\subseteq(\ell, \Psi)$ ;  $\mathtt{lAff}^\subseteq(\ell, \Psi)$ ) is defined as  $\mathtt{lCvx}(\ell, \Psi, W)$  (resp.,  $\mathtt{lAff}(\ell, \Psi, W)$ ;  $\mathtt{lCvx}^\subseteq(\ell, \Psi, W)$ ;  $\mathtt{lAff}^\subseteq(\ell, \Psi, W)$ ) with W = Z;
- (v) if condition (L) holds, then  $\mathtt{lCvx}(\Psi)$  (resp.,  $\mathtt{lAff}(\Psi)$ ;  $\mathtt{lCvx}^\subseteq(\Psi)$ ;  $\mathtt{lAff}^\subseteq(\Psi)$ ) is a category defined as  $\mathtt{lCvx}(\ell,\Psi)$  (resp.,  $\mathtt{lAff}(\ell,\Psi)$ ;  $\mathtt{lCvx}^\subseteq(\ell,\Psi)$ ;  $\mathtt{lAff}^\subseteq(\ell,\Psi)$ ) with  $(X,\|\cdot\|_X)=(Y,\|\cdot\|_Y)$  and  $Z=\mathrm{int}(\mathrm{efd}(\Psi))$ ;
- (vi) if condition (R) holds, then  $\bar{\mathbf{r}}\mathsf{Cvx}(\ell, \Psi, W)$  is a category with objects given by  $\mathfrak{D}^G\Psi \circ \ell$ -closed  $\mathfrak{D}^G\Psi \circ \ell$ -convex subsets of W, including  $\varnothing$ ; morphisms given by right  $D_{\ell,\Psi}$ -projections onto  $\mathfrak{D}^G\Psi \circ \ell$ -closed  $\mathfrak{D}^G\Psi \circ \ell$ -convex subsets of these subsets, including  $\varnothing$ ; identity morphisms given by  $\overrightarrow{\mathfrak{P}}_C^{\Phi}(C) = C$ ; composition of morphisms given by

$$\overrightarrow{\mathfrak{P}}_{C_{2}}^{D_{\ell,\Psi}} \diamond \overrightarrow{\mathfrak{P}}_{C_{1}}^{D_{\ell,\Psi}} := \ell^{-|} \circ \mathfrak{D}^{G} \Psi^{\mathbf{F}} \circ \left( \overrightarrow{\mathfrak{P}}_{(\mathfrak{D}^{G} \Psi \circ \ell)(C_{2})}^{D_{\Psi}\mathbf{F}} \diamond \overrightarrow{\mathfrak{P}}_{(\mathfrak{D}^{G} \Psi \circ \ell)(C_{1})}^{D_{\Psi}\mathbf{F}} \right) \circ \mathfrak{D}^{G} \Psi \circ \ell, \tag{144}$$

- (vii) if condition (R) holds, then  $\bar{\mathbf{r}}\mathsf{Aff}(\ell,\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Cvx}\subseteq(\ell,\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Aff}\subseteq(\ell,\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Cvx}(\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Aff}(\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Cvx}\subseteq(\Psi)$ ,  $\bar{\mathbf{r}}\mathsf{Aff}\subseteq(\Psi)$  are categories defined analogously as in (ii)–(v), with  $\mathsf{l}\mathsf{Cvx}(\ell,\Psi)$  replaced by  $\bar{\mathbf{r}}\mathsf{Cvx}(\ell,\Psi)$ ;
- (viii)  $\operatorname{CN}(\ell, \Psi, W)$  is a category with subsets of W as objects, elements of  $\operatorname{CN}(\ell, \Psi, W)$  as morphisms, identity maps of subsets as identity morphisms, and composition of morphisms given by composition of elements in  $\operatorname{CN}(\ell, \Psi, W)$ ;  $\operatorname{CN}(\ell, \Psi)$  will denote  $\operatorname{CN}(\ell, \Psi, W)$  for W = Z;
  - (ix) for any set V, let Pow(V) denote the category of all subsets of V as objects, with functions between them as morphisms, and composition of functions as composition of morphisms.

**Definition 3.40.** Let  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  be Banach spaces, let  $(X, \|\cdot\|_X)$  be reflexive,  $Z \subseteq Y$ ,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\ell: Z \to \mathrm{int}(\mathrm{efd}(\Psi))$  be a bijection. Then

- (i) if conditions (L) and (R) hold, then  $(\cdot)^{\Psi^{\mathbf{F}}}: \mathtt{1Cvx}(\ell, \Psi) \to \bar{\mathtt{r}}\mathtt{Cvx}(\ell, \Psi)$  is a functor, acting by  $C\mapsto \ell^{-1}\circ \mathfrak{D}^{\mathrm{G}}\Psi\circ \ell(C)$  on objects  $C\in \mathrm{Ob}(\mathtt{lCvx}(\ell,\Psi)),\ with\ (\varnothing)^{\Psi^{\mathbf{F}}}:=\varnothing,\ and\ by\ T\mapsto \ell^{-1}\circ (-1)^{-1}$  $\mathfrak{D}^{\mathrm{G}}\Psi^{\mathbf{F}}\circ T\circ \mathfrak{D}^{\mathrm{G}}\Psi\circ \ell \ on \ morphisms \ \ell^{-|}\circ T\circ \ell\in \mathrm{Arr}(\mathsf{1Cvx}(\ell,\Psi)), \ with \ (\lceil\varnothing\rceil)^{\Psi^{\mathbf{F}}}:=\lceil\varnothing\rceil;$
- (ii) if conditions (L) and (R) hold, then  $(\cdot)^{\Psi}$ :  $\bar{\mathbf{r}}\mathsf{Cvx}(\ell,\Psi) \to \mathbf{1}\mathsf{Cvx}(\ell,\Psi)$  is a functor, acting by  $C \mapsto \ell^{-1} \circ \mathfrak{D}^{\mathsf{G}}\Psi^{\mathbf{F}} \circ \ell(C)$  on objects  $C \in \mathsf{Ob}(\bar{\mathbf{r}}\mathsf{Cvx}(\ell,\Psi))$ , with  $(\varnothing)^{\Psi} := \varnothing$ , and by  $T \mapsto \ell^{-1} \circ \mathfrak{D}^{\mathsf{G}}\Psi \circ \ell(C)$  $T\circ\mathfrak{D}^{\mathrm{G}}\Psi^{\mathbf{F}}\circ\ell\ on\ morphisms\ \underline{\ell^{-|}}\circ T\circ\ell\in\mathrm{Arr}(\bar{\mathtt{r}}\mathtt{Cvx}(\ell,\Psi)),\ with\ (\lceil\varnothing\rceil)^{\Psi}:=\lceil\varnothing\rceil;$
- (iii) if condition (L) holds, then  $\overline{\operatorname{co}_{\Psi}^{\operatorname{L}}(\cdot)}^{w}:\operatorname{Pow}(X)\to\operatorname{1Cvx}(\Psi)$  is a functor, defined by:
  - 1) a map  $\overline{\operatorname{co}_{\Psi}^{\operatorname{L}}(\cdot)}^w : \operatorname{Ob}(\operatorname{Pow}(X)) \to \operatorname{Ob}(\operatorname{Pow}(X))$ , assigning to each subset W of X the closure  $\dot{w}$  of a convex hull  $\operatorname{co}(\cdot)$  of  $W \cap \operatorname{int}(\operatorname{efd}(\Psi))$  in the weak topology of  $(X, \|\cdot\|_X)$  (it coincides with the norm closure) if  $\overline{\operatorname{co}(W \cap \operatorname{int}(\operatorname{efd}(\Psi)))}^w \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , and assigning  $\varnothing$  otherwise,
  - 2)  $a \ map \ \overline{\cot_{\Psi}^{L}(\cdot)}^{w} : \operatorname{Arr}(\operatorname{Pow}(X)) \to \operatorname{Arr}(\operatorname{Pow}(X)), \ assigning \ to \ each \ function \ f: W_{1} \to W_{2} \ a \ map \ \overline{\mathfrak{P}}_{Q}^{D_{\Psi}} : \overline{\cot_{\Psi}^{L}(W_{1})}^{w} \to \overline{\cot_{\Psi}^{L}(W_{2})}^{w}, \ where \ Q := \overline{\cot_{\Psi}^{L}(f(W_{1}))}^{w}, \ with \ \overline{\mathfrak{P}}_{Q}^{D_{\Psi}} = \lceil \varnothing \rceil \ if \ either \ a \ cot \ f(W_{1}) = 1 \ cot \ f(W$  $Q = \varnothing \text{ or } \overline{\operatorname{co}_{\mathsf{T}}^{\mathsf{L}}(W_1)}^w = \varnothing;$
- (iv) if condition (R) holds, then  $\overline{\operatorname{co}_{\Psi}^{\mathrm{R}}(\cdot)}^{w} : \operatorname{Pow}(X) \to \overline{\operatorname{r}}\operatorname{Cvx}(\Psi)$  is a functor, defined by:
  - 1) a map  $\overline{\cot^{\mathbb{R}}_{\Psi}(\cdot)}^{w} : \operatorname{Ob}(\operatorname{Pow}(X)) \to \operatorname{Ob}(\operatorname{Pow}(X))$ , assigning to each subset W of X the set  $\mathfrak{D}^{\mathrm{G}}\Psi^{\mathbf{F}}\left(\overline{\cot(\mathfrak{D}^{\mathrm{G}}\Psi(W)\cap \operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}})))}^{w}\right)$  (with  $\overline{\phantom{a}}^{w}$  denoting a closure in a weak topology of  $(X^{\star}, \|\cdot\|_{X^{\star}}))$  if  $\overline{\operatorname{co}(\mathfrak{D}^{\operatorname{G}}\Psi(W)\cap\operatorname{int}(\operatorname{efd}(\Psi^{\operatorname{\mathbf{F}}})))}^{w}\subseteq\operatorname{int}(\operatorname{efd}(\Psi^{\operatorname{\mathbf{F}}}))$ , and assigning  $\varnothing$  otherwise,
  - 2)  $a \ map \ \overrightarrow{\nabla}_{Q}^{D_{\Psi}} : \overrightarrow{\operatorname{Co}_{\Psi}^{R}(W_{1})}^{w} : \operatorname{Arr}(\operatorname{Pow}(X)) \to \operatorname{Arr}(\operatorname{Pow}(X)), \ assigning \ to \ each \ function \ f : W_{1} \to W_{2} \ a \ map \ \overrightarrow{\mathfrak{P}}_{Q}^{D_{\Psi}} : \overrightarrow{\operatorname{co}_{\Psi}^{R}(W_{1})}^{w} \to \overrightarrow{\operatorname{co}_{\Psi}^{R}(W_{2})}^{w}, \ where \ Q := \overrightarrow{\operatorname{co}_{\Psi}^{R}(f(W_{1}))}^{w}, \ with \ \overleftarrow{\mathfrak{P}}_{Q}^{D_{\Psi}} = \lceil \varnothing \rceil \ \text{if either}$  $Q = \varnothing \text{ or } \overline{\operatorname{co}_{\Psi}^{\mathrm{R}}(W_1)}^{w} = \varnothing;$
- $(v) \ \overline{\cot^{L}_{\ell,\Psi}(\cdot)^{\ell}} : \operatorname{Pow}(Z) \to \operatorname{1Cvx}(\ell,\Psi) \ and \ \overline{\cot^{R}_{\ell,\Psi}(\cdot)^{\ell}} : \operatorname{Pow}(Z) \to \overline{\operatorname{r}}\operatorname{Cvx}(\ell,\Psi) \ are \ functors \ defined \ analogously \ to \ the \ corresponding \ functors \ in \ (iii) (iv), \ by \ the \ bijectivity \ of \ \ell;$   $(vi) \ \overline{\cot^{L,\subseteq}_{\ell,\Psi}(\cdot)^{\ell}} : \operatorname{Pow}(Z) \to \operatorname{1Cvx}^{\subseteq}(\ell,\Psi) \ (resp., \ \overline{\cot^{R,\subseteq}_{\ell,\Psi}(\cdot)^{\ell}}) : \operatorname{Pow}(Z) \to \overline{\operatorname{r}}\operatorname{Cvx}^{\subseteq}(\ell,\Psi)) \ is \ defined \ as \ a$   $\operatorname{restriction} \ of \ the \ functor \ \overline{\cot^{L}_{\ell,\Psi}(\cdot)^{\ell}} \ (resp., \ \overline{\cot^{R,\subseteq}_{\ell,\Psi}(\cdot)^{\ell}}) \ by \ the \ additional \ condition \ \ \overline{\mathfrak{P}}^{D_{\ell,\Psi}}_{\ell^{-1}(Q)} = \lceil \varnothing \rceil \ if$  $Q \not\subseteq \overline{\operatorname{co}^{\operatorname{L}}_{\ell,\Psi}(W_1)}^{\ell} \ (\operatorname{resp.}, \ \overrightarrow{\mathfrak{P}}^{D_{\ell,\Psi}}_{\ell^{-1}(Q)} = \ulcorner \varnothing \urcorner \ \operatorname{if} \ Q \not\subseteq \overline{\operatorname{co}^{\operatorname{R}}_{\ell,\Psi}(W_1)}^{\ell});$
- (vii) if condition (L) (resp., (R)) holds, then  $\operatorname{FrgSet}_{\ell,\Psi}^L: \operatorname{1Cvx}(\ell,\Psi) \to \operatorname{Pow}(Z)$  (resp.,  $\operatorname{FrgSet}_{\ell,\Psi}^R: \operatorname{\overline{r}Cvx}(\ell,\Psi) \to \operatorname{Pow}(Z)$ ) denotes a forgetful functor, forgetting all properties of domain category, except their structure as sets and functions between them;  $\operatorname{FrgSet}_{\ell,\Psi}^{L,\subseteq}$  (resp.,  $\operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq}$ ) will denote a restriction of  $\operatorname{FrgSet}^{\operatorname{L}}_{\ell,\Psi}$  (resp.,  $\operatorname{FrgSet}^{\operatorname{R}}_{\ell,\Psi}$ ) to the category  $\operatorname{\mathtt{lCvx}}^\subseteq(\ell,\Psi)$  (resp.,  $\operatorname{\overline{rCvx}}^\subseteq(\ell,\Psi)$ ).

(i) Functors  $(\cdot)^{\Psi}$  and  $(\cdot)^{\Psi^{\mathbf{F}}}$  establish equivalence of categories  $\mathtt{1Cvx}(\ell, \Psi)$  and  $\bar{\mathtt{r}}\mathtt{Cvx}(\ell, \Psi)$ . Corollary 3.41.

 $(ii) \ \ \textit{There are the following adjunctions of functors:} \ \ \overline{\text{co}^{\text{L}}_{\ell,\Psi}(\cdot)}^{\text{L}} \ \dashv \ \text{FrgSet}^{\text{L}}_{\ell,\Psi}, \ \ \overline{\text{co}^{\text{L},\subseteq}_{\ell,\Psi}(\cdot)}^{\text{L},\subseteq} \ \dashv \ \text{FrgSet}^{\text{L},\subseteq}_{\ell,\Psi},$  $\overline{\operatorname{co}^R_{\ell,\Psi}(\cdot)}^\ell\dashv\operatorname{FrgSet}^R_{\ell,\Psi},\ \overline{\operatorname{co}^{R,\subseteq}_{\ell,\Psi}(\cdot)}^\ell\dashv\operatorname{FrgSet}^{R,\subseteq}_{\ell,\Psi}.$ 

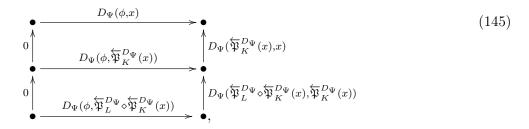

(i) Follows from (144).

(ii) Follows from the definition of the forgetful functor.

**Proposition 3.42.** Let  $[0,\infty]$  denote a category consisting of one object,  $\bullet$ , with morphisms given by the elements of the set  $\mathbb{R}^+ \cup \{\infty\}$ , and their composition defined by addition [214, p. 140]. Let 2 denote the category consisting of two objects, one arrow between them, and identity arrows on both of the objects. The category  $[0,\infty]^2$  has morphisms of  $[0,\infty]$  as objects, commutative squares in  $[0,\infty]$  as morphisms, and commutative compositions of these squares as compositions. Let Q be a closed affine subset of a reflexive Banach space  $(X, \|\cdot\|_X)$ ,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_X)$  satisfies condition (L),  $\phi \in Q$ , and let  $\mathtt{lAff}_{O}^{\subseteq}(\Psi)$  denotes a subcategory of  $\mathtt{lAff}^{\subseteq}(\Psi)$  with objects restricted to sets  $C \in \mathsf{Ob}(\mathtt{lAff}^{\subseteq}(\Psi))$  such that  $Q \subseteq C$ . Then  $D_{\Psi}(\phi, \cdot)$  determines a contravariant functor  $\mathtt{lAff}_{Q}^{\subseteq}(\Psi) \to [0, \infty]^2$  as well as a family of natural transformations in the category of functors  $\mathtt{lAff}_Q^\subseteq(\Psi) \to [0,\infty]$ . Analogous statement holds for  $\mathtt{lAff}^\subseteq(\Psi)$  (resp.,  $D_\Psi(\phi,\,\cdot\,)$ ) replaced by  $\mathtt{lAff}^\subseteq(\ell,\Psi)$  (resp.,  $D_{\ell,\Psi}(\phi,\,\cdot\,)$ ), or by  $\bar{\mathtt{r}}\mathtt{Aff}^\subseteq(\Psi)$  (resp.,

 $D_{\Psi}(\cdot,\phi)$ ), or by  $\bar{\mathbf{r}}\mathsf{Aff}^{\subseteq}(\ell,\Psi)$  (resp.,  $D_{\ell,\Psi}(\cdot,\phi)$ ) (last two cases require also to replace condition (L) by condition (R)).

*Proof.* Let  $K_1, K_2, K_3, K, L \in \text{Ob}(\mathtt{lAff}_Q^{\subseteq}(\Psi))$ ,  $K \subseteq K_2$  and  $L \subseteq K_3$ . For each  $\phi \in Q$ , left pythagorean equation implies commutativity of the diagram

and hence also of

This defines a contravariant functor  $D_{\Psi}(\phi,\cdot): \mathtt{lAff}_{\mathcal{O}}^{\subseteq}(\Psi) \to [0,\infty]^2$ .

For any two categories C and D, cartesian closedness of the category Cat of all small categories (with natural transformations as morphisms) implies that any functor  $C \to D^2$  corresponds to a natural transformation in  $D^C$ .

**Definition 3.43.** Let  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  be Banach spaces, let  $(X, \|\cdot\|_X)$  be reflexive,  $\varnothing \neq W \subseteq Z \subseteq Y$ ,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\ell : Z \to \mathrm{int}(\mathrm{efd}(\Psi))$  be a bijection. Then:

(i) if  $\Psi$  is LSQ-compositional on  $\ell(W)$ , then  $LSQ_{cvx}^{\subseteq}(\Psi, \ell(W))$  is a category with: objects given by convex closed subsets of  $\ell(W)$ , including  $\varnothing$ ; morphisms given by

$$\operatorname{Hom}_{\operatorname{LSQ}_{\operatorname{cvx}}^{\subseteq}(\Psi,\ell(W))}(K_1,K_2) := \begin{cases} \lceil \varnothing \rceil & : K_2 \not\subseteq K_1 \\ \{T_i \in \operatorname{LSQ}(\Psi,K_1) : K_2 \supseteq \operatorname{ran}(T_i) \} & : K_2 \subseteq K_1; \end{cases}$$
(147)

composition of morphisms  $(f: K_2 \to K_3) \diamond (g: K_1 \to K_2)$  given by

$$\begin{cases} (f \circ g) : K_1 \to K_2 : \widehat{\operatorname{Fix}}(f \circ g) = \widehat{\operatorname{Fix}}(f) \cap \widehat{\operatorname{Fix}}(g) \neq \emptyset \\ \vdash \varnothing \vdash : \text{ otherwise;} \end{cases}$$
(148)

identity given by  $\{id_K : K \to K\} \in LSQ(\Psi, K)$ ;

- (ii)  $LSQ_{cvx}^{\subseteq}(\ell, \Psi, W)$  is a category defined by pulling back  $LSQ_{cvx}^{\subseteq}(\Psi, \ell(W))$  along  $\ell$ ;  $LSQ_{cvx}^{\subseteq}(\Psi, \psi)$  is defined as  $LSQ_{cvx}^{\subseteq}(\Psi, \ell(W))$  (resp.,  $LSQ_{cvx}^{\subseteq}(\ell, \Psi, W)$ ) with W = Z;
- (iii) if  $\Psi$  is RSQ-compositional, then the categories  $\overline{\mathtt{RSQ}}^\subseteq_{\mathrm{cvx}}(\Psi, \ell(W))$ ,  $\overline{\mathtt{RSQ}}^\subseteq_{\mathrm{cvx}}(\ell, \Psi, W)$ ,  $\overline{\mathtt{RSQ}}^\subseteq_{\mathrm{cvx}}(\ell, \Psi)$ , and  $\overline{\mathtt{RSQ}}^\subseteq_{\mathrm{cvx}}(\Psi)$  are defined analogously to (i)–(ii), by replacing  $\mathrm{LSQ}(\Psi, K)$  with  $\mathrm{RSQ}(\Psi, K)$ , and replacing convex closed subsets of  $\ell(W)$  by  $\mathfrak{D}^G\Psi$ -convex  $\mathfrak{D}^G\Psi$ -closed subsets of  $\ell(W)$ .

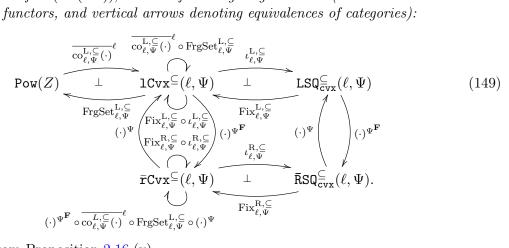

**Definition 3.44.** Let  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  be Banach spaces, let  $(X, \|\cdot\|_X)$  be reflexive,  $Z \subseteq Y$ ,  $\Psi \in \Gamma^{\mathrm{G}}(X, \|\cdot\|_X)$ ,  $\ell : Z \to \mathrm{int}(\mathrm{efd}(\Psi))$  be a bijection. Then:

(i) if  $\Psi$  is LSQ-compositional and RSQ-compositional, then  $(\cdot)^{\Psi^{\mathbf{F}}}: LSQ_{\mathsf{cvx}}^{\subseteq}(\ell, \Psi) \to \overline{\mathtt{R}}SQ_{\mathsf{cvx}}^{\subseteq}(\ell, \Psi)$  denotes a functor, acting by  $C \mapsto \ell^{-1} \circ \mathfrak{D}^{\mathsf{G}}\Psi \circ \ell(C)$  on objects  $C \in \mathsf{Ob}(\mathsf{LSQ}_{\mathsf{cvx}}^{\subseteq}(\ell, \Psi))$ , with  $(\varnothing)^{\Psi^{\mathbf{F}}} := \varnothing$ , and by  $T \mapsto \ell^{-1} \circ \mathfrak{D}^{\mathsf{G}}\Psi^{\mathsf{F}} \circ \mathfrak{D}^{\mathsf{G}}\Psi \circ \ell$  on morphisms  $\ell^{-1} \circ T \circ \ell \in \mathsf{Arr}(\mathsf{LSQ}_{\mathsf{cvx}}^{\subseteq}(\ell, \Psi))$ , with  $({}^{\mathsf{C}}\varnothing^{\mathsf{T}})^{\Psi^{\mathsf{F}}} := {}^{\mathsf{C}}\varnothing^{\mathsf{T}};$ 

- (ii) if  $\Psi$  is LSQ-compositional and RSQ-compositional, then  $(\cdot)^{\Psi}: \overline{\mathtt{RSQ}}^{\subseteq}_{\mathsf{cvx}}(\ell, \Psi) \to \mathtt{LSQ}^{\subseteq}_{\mathsf{cvx}}(\ell, \Psi)$  denotes a functor, acting by  $C \mapsto \ell^{-|} \circ \mathfrak{D}^G \Psi^{\mathbf{F}} \circ \ell(C)$  on objects  $C \in \mathrm{Ob}(\overline{\mathtt{RSQ}}^{\subseteq}_{\mathsf{cvx}}(\ell, \Psi))$ , with  $(\varnothing)^{\Psi} := \varnothing$ , and by  $T \mapsto \ell^{-|} \circ \mathfrak{D}^G \Psi \circ T \circ \mathfrak{D}^G \Psi^{\mathbf{F}} \circ \ell$  on morphisms  $\ell^{-|} \circ T \circ \ell \in \mathrm{Arr}(\overline{\mathtt{RSQ}}^{\subseteq}_{\mathsf{cvx}}(\ell, \Psi))$ , with  $(\lceil \varnothing \rceil)^{\Psi} := \lceil \varnothing \rceil$ ;
- (iii) if condition (L) holds,  $\Psi$  is LSQ-compositional, and  $\Psi$  is LSQ-adapted on any convex closed  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi)), \text{ then } \iota^{L,\subseteq}_{\ell,\Psi} : \operatorname{1Cvx}^\subseteq(\ell,\Psi) \hookrightarrow \operatorname{LSQ}^\subseteq_{\operatorname{cvx}}(\ell,\Psi) \text{ denotes an embedding functor;}$
- (iv) if condition (R) holds,  $\Psi$  is RSQ-compositional, and  $\Psi$  is RSQ-adapted on any  $\mathfrak{D}^G\Psi$ -convex  $\mathfrak{D}^G\Psi$ -closed  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , then  $\iota_{\ell,\Psi}^{R,\subseteq} : \bar{\mathbf{r}}\operatorname{Cvx}^\subseteq(\ell,\Psi) \hookrightarrow \bar{\mathtt{R}}\operatorname{SQ}^\subseteq_{\operatorname{cvx}}(\ell,\Psi)$  denotes an embedding
- (v) if condition (L) holds and  $\Psi$  is LSQ-compositional, then  $\operatorname{Fix}_{\ell,\Psi}^{L,\subseteq}: \operatorname{LSQ}_{\operatorname{cvx}}^\subseteq(\ell,\Psi) \to \operatorname{1Cvx}^\subseteq(\ell,\Psi)$ denotes a functor, acting as an identity map on objects, and as an assignment  $\ell^{-1} \circ T \circ \ell \mapsto$  $\overleftarrow{\mathfrak{P}}^{D_{\ell,\Psi}}_{\ell^{-|}(\mathrm{Fix}(T))} \ \ to \ \ each \ \ \ell^{-|} \circ T \circ \ell \in \mathrm{Arr}(\mathtt{LSQ}^\subseteq_{\mathsf{cvx}}(\ell,\Psi));$
- $(vi) \ \ \textit{if condition} \ \ (R) \ \ \textit{holds} \ \ \textit{and} \ \ \Psi \ \ \textit{is} \ \ RSQ\text{-}\textit{compositional}, \ \ \textit{then} \ \ \mathrm{Fix}_{\ell,\Psi}^{R,\subseteq} : \ \overline{\mathtt{R}} \mathtt{SQ}_{\mathtt{cvx}}^\subseteq(\ell,\Psi) \ \rightarrow \ \bar{\mathtt{r}} \mathtt{Cvx}^\subseteq(\ell,\Psi)$ denotes a functor, acting as an identity map on objects, and as an assignment  $\ell^{-1} \circ T \circ \ell \mapsto$  $\overrightarrow{\mathfrak{P}}_{\ell^{-1}(\mathrm{Fix}(T))}^{D_{\ell,\Psi}} \ to \ each \ \ell^{-1} \circ T \circ \ell \in \mathrm{Arr}(\bar{\mathtt{R}} \mathtt{SQ}_{\mathtt{cvx}}^\subseteq(\ell,\Psi)).$

**Proposition 3.45.** Let  $(X, \|\cdot\|_X)$  and  $(Y, \|\cdot\|_Y)$  be Banach spaces, let  $(X, \|\cdot\|_X)$  be reflexive,  $Z \subseteq Y$ ,  $\Psi \in \Gamma^{G}(X, \|\cdot\|_{Y}), \ \ell : Z \to \operatorname{int}(\operatorname{efd}(\Psi)) \ be \ a \ bijection. \ Then:$ 

- (i) if  $\Psi$  is LSQ-compositional, RSQ-compositional, Euler-Legendre,  $\mathfrak{D}^{\rm G}\Psi$  is (uniformly continuous and bounded) on open subsets of  $\operatorname{int}(\operatorname{efd}(\Psi))$ , and  $\mathfrak{D}^G\Psi^F$  is (uniformly continuous and bounded) on open subsets of  $\operatorname{int}(\operatorname{efd}(\Psi^{\mathbf{F}}))$ , then  $(\cdot)^{\Psi^{\mathbf{F}}}$  establish an equivalence of categories  $LSQ_{cvx}^{\subseteq}(\ell, \Psi)$  and  $\bar{R}SQ_{cvx}^{\subseteq}(\ell, \Psi)$ ;
- (ii) if condition (L) holds,  $\Psi$  is LSQ-adapted on any convex closed  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ , and LSQcompositional, then there are adjunctions  $\iota_{\ell,\Psi}^{L,\subseteq} \dashv \operatorname{Fix}_{\ell,\Psi}^{L,\subseteq}$  and  $\iota_{\ell,\Psi}^{L,\subseteq} \circ \operatorname{col}_{\ell,\Psi}^{L,\subseteq} (\cdot)^{\ell} \dashv \operatorname{FrgSet}_{\ell,\Psi}^{L,\subseteq} \circ \operatorname{Fix}_{\ell,\Psi}^{L,\subseteq} (\cdot)^{\ell}$  with a monad  $\operatorname{Fix}_{\ell,\Psi}^{L,\subseteq} \circ \iota_{\ell,\Psi}^{L,\subseteq}$  on  $\operatorname{1Cvx}^{\subseteq}(\ell,\Psi)$ , and a comonad  $\operatorname{col}_{\ell,\Psi}^{L,\subseteq} (\cdot)^{\ell} \circ \operatorname{FrgSet}_{\ell,\Psi}^{L,\subseteq}$  on  $\operatorname{1Cvx}^{\subseteq}(\ell,\Psi)$ ; (iii) if condition (R) holds,  $\Psi$  is RSQ-adapted on any  $\mathfrak{D}^{G}\Psi$ -convex  $\mathfrak{D}^{G}\Psi$ -closed  $\varnothing \neq K \subseteq \operatorname{int}(\operatorname{efd}(\Psi))$ ,
- and RSQ-compositional, then there are adjunctions  $\iota_{\ell,\Psi}^{R,\subseteq} \dashv \operatorname{Fix}_{\ell,\Psi}^{R,\subseteq}$  and  $\iota_{\ell,\Psi}^{R,\subseteq} \circ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}}(\cdot)^{\ell} \dashv \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \circ$  $\operatorname{Fix}_{\ell,\Psi}^{R,\subseteq}, \ \textit{with a monad} \ \operatorname{Fix}_{\ell,\Psi}^{R,\subseteq} \circ \iota_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \bar{\operatorname{r}} \operatorname{Cvx}^\subseteq(\ell,\Psi), \ \textit{and a comonad} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \overline{\operatorname{r}} \operatorname{Cvx}^2(\ell,\Psi), \ \textit{and a comonad} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \overline{\operatorname{r}} \operatorname{Cvx}^2(\ell,\Psi), \ \textit{and a comonad} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \overline{\operatorname{r}} \operatorname{Cvx}^2(\ell,\Psi), \ \textit{and a comonad} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \overline{\operatorname{r}} \operatorname{Cvx}^2(\ell,\Psi), \ \textit{on} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \text{on} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \text{on} \ \overline{\operatorname{co}_{\ell,\Psi}^{R,\subseteq}(\cdot)}^\ell \circ \operatorname{FrgSet}_{\ell,\Psi}^{R,\subseteq} \ \textit{on} \ \text{on} \ \text{$
- (iv) if conditions (L) and (R) hold,  $\Psi$  is LSQ-adapted on any convex closed nonempty subset of  $\operatorname{int}(\operatorname{efd}(\Psi)), RSQ$ -adapted on any  $\mathfrak{D}^{G}\Psi$ -convex  $\mathfrak{D}^{G}\Psi$ -closed nonempty subset of  $\operatorname{int}(\operatorname{efd}(\Psi)),$ LSQ-compositional, and RSQ-compositional, Euler-Legendre,  $\mathfrak{D}^G\Psi$  is (uniformly continuous and bounded) on bounded subsets of  $int(efd(\Psi))$ , and  $\mathfrak{D}^G\Psi^F$  is (uniformly continuous and bounded) on bounded subsets of  $int(efd(\Psi^{\mathbf{F}}))$ , then the following diagram holds (with the horizontal arrows denoting adjoint functors, and vertical arrows denoting equivalences of categories):

Proof. (i) Follows from Proposition 2.16.(v). (ii) The adjunction  $\iota_{\ell,\Psi}^{L,\subseteq} \dashv \operatorname{Fix}_{\ell,\Psi}^{L,\subseteq}$  follows from Definition 2.22, while the composite adjunction follows from Corollary 3.41.(ii). The corresponding monad and comonad are determined by the latter adjunction.

- (iii) Follows from Definition 2.22 and Corollary 3.41.(ii).
- (iv) Follows from (i)-(iii).

Corollary 3.46. Let  $(Y, \|\cdot\|_Y)$  be a Banach space, let  $(X, \|\cdot\|_X)$  be a uniformly Fréchet differentiable, strictly convex Banach space with the Radon-Riesz-Shmul'yan property, let  $Z \subseteq Y$ ,  $\ell: Z \to \operatorname{int}(\operatorname{efd}(\Psi))$  be a bijection, let  $\varphi$  be a gauge. Then:

(i) there are adjunctions

$$\operatorname{Pow}(Z) \underbrace{ \begin{array}{c} \overset{\operatorname{L},\subseteq}{\operatorname{co}_{\ell,\Psi_{\varphi}}(\cdot)}^{\ell} \\ \bot \\ \operatorname{FrgSet}_{\ell,\Psi_{\varphi}}^{\operatorname{L},\subseteq} \end{array} } \operatorname{1Cvx}^{\subseteq}(\ell,\Psi_{\varphi}) \underbrace{ \begin{array}{c} \overset{\operatorname{L},\subseteq}{\iota_{\ell,\Psi_{\varphi}}} \\ \bot \\ \operatorname{Fix}_{\ell,\Psi_{\varphi}}^{\operatorname{L},\subseteq} \end{array} } \operatorname{LSQ}_{\operatorname{cvx}}^{\subseteq}(\ell,\Psi_{\varphi})$$

$$(150)$$

and

$$\operatorname{Pow}(Z) \underbrace{ \frac{\operatorname{co}_{\ell,\Psi_{\varphi}}^{R,\subseteq}(\cdot)^{\ell}}{\perp} \operatorname{Cvx}^{\subseteq}(\ell,\Psi_{\varphi}),}_{\operatorname{FrgSet}_{\ell,\Psi_{\varphi}}^{R,\subseteq}}$$
(151)

with corresponding monads and comonads, and there are also equivalences

$$\bar{\mathbf{r}}\mathbf{C}\mathbf{v}\mathbf{x}^{\subseteq}(\ell, \Psi_{\varphi})\underbrace{\phantom{+}\mathbf{C}\mathbf{v}\mathbf{x}^{\subseteq}(\ell, \Psi_{\varphi}),}_{(\cdot)^{(\Psi_{\varphi})^{\mathbf{F}}}}\mathbf{1}\mathbf{C}\mathbf{v}\mathbf{x}^{\subseteq}(\ell, \Psi_{\varphi}),\tag{152}$$

$$\bar{\mathbb{R}} SQ_{cvx}^{\subseteq}(\ell, \Psi_{\varphi}) \underbrace{ \underbrace{(\cdot)^{\Psi_{\varphi}}}_{(\cdot)^{(\Psi_{\varphi})^{F}}} LSQ_{cvx}^{\subseteq}(\ell, \Psi_{\varphi});$$

$$(153)$$

(ii) if  $(X, \|\cdot\|_X)$  is uniformly convex, then there is an adjunction

$$\bar{\mathbf{r}}\mathbf{C}\mathbf{v}\mathbf{x}^{\subseteq}(\ell, \Psi_{\varphi}) \underbrace{\qquad \qquad \qquad \qquad \qquad \qquad \qquad }_{\mathrm{Fix}^{\mathrm{R}, \subseteq}_{\ell, \Psi_{\varphi}}} \bar{\mathbf{R}}\mathbf{SQ}^{\subseteq}_{\mathbf{c}\mathbf{v}\mathbf{x}}(\ell, \Psi_{\varphi}), \tag{154}$$

together with the corresponding monads and comonads.

*Proof.* Follows from Propositions 3.45 and 3.24.

#### Remark 3.47. (i) Regarding Definition 3.39:

- a) the restriction to subsets of  $\ell^{-1}(\operatorname{int}(\operatorname{efd}(\Psi)))$ , together with condition (L) (resp., (R)), guarantees composability of  $\diamond$  by means of zone consistency of  $\mathfrak{P}_{C}^{D_{\ell,\Psi}}$  (resp.,  $\mathfrak{P}_{C}^{D_{\ell,\Psi}}$ ), via Corollary 3.37.(iii).2) (resp. Corollary 3.37.(iv).2));
- b)  $C_1 \cap C_2 = C_2 \cap C_1$  implies commutativity of  $\diamond$ ;
- c) we interpret an empty (resp., identity) arrow as an inference corresponding to overdetermination (resp., underdetermination) of constraints (cf. [178, p. 35] for a related discussion);
- d) the notation  $\mathtt{rCvx}(\ell, \Psi)$  (resp.,  $\mathtt{rAff}(\ell, \Psi)$ ) is kept reserved for the category of right  $D_{\ell, \Psi}$ projections onto  $\ell$ -closed and  $\ell$ -convex (resp.,  $\ell$ -closed and  $\ell$ -afine) subsets of Z. An example
  of  $\mathtt{rCvx}(\Psi)$  is provided by [46, p. 192, Def. 3.1, Lemm. 3.5]: if  $X = \mathbb{R}^n$ ,  $\Psi$  is Euler–
  Legendre with  $\mathfrak{D}^G\mathfrak{D}^G\Psi$  continuous on  $\mathrm{int}(\mathrm{efd}(\Psi))$ ,  $D_{\Psi}$  is jointly convex,  $D_{\Psi}(x, \cdot)$  is strictly
  convex on  $\mathrm{int}(\mathrm{efd}(\Psi)) \ \forall x \in \mathrm{int}(\mathrm{efd}(\Psi))$ , and  $\mathrm{efd}(\Psi^F)$  is open, then every convex closed  $K \subseteq X$  with  $K \cap \mathrm{int}(\mathrm{efd}(\Psi)) \neq \emptyset$  is a right  $D_{\Psi}$ -Chebyshëv set, with  $\overrightarrow{\mathfrak{P}}_K^{D_{\Psi}}(y) \in \mathrm{int}(\mathrm{efd}(\Psi))$   $\forall y \in \mathrm{int}(\mathrm{efd}(\Psi))$ .

(ii) a) The composition rule  $\diamond$  for left  $D_{\Psi}$ -projections has a range of well defined computational meanings. Its quantitative evaluation can be performed by means of an algorithm given in [42, Rem. 4.5, Alg. 5.1, Cor. 5.2] (valid for any countable family  $\{K_i: i \in I\}$  and any Euler-Legendre  $\Psi$  that is totally convex<sup>27</sup> on bounded subsets of  $(X, \|\cdot\|_X)$ , hence, in particular, for any LSQ-adapted  $\Psi$ ), or by means of [44, Thm. 3.2] [68, Alg. 2.4, Thm. 3.1] [125, Alg. B] (valid for dim  $X < \infty$ , a finite family  $\{K_i: i \in \{1, \ldots, n\}, n \in \mathbb{N}\}$ , and Euler-Legendre  $\Psi$  satisfying some additional conditions). For  $(X, \|\cdot\|_X)$  given by the Hilbert space  $(\mathcal{H}, \|\cdot\|_{\mathcal{H}})$  and  $\Psi_{\varphi_{1,1/2}} = \frac{1}{2} \|\cdot\|_{\mathcal{H}}^2$ , the former algorithm turns to Haugazeau's [159, Thm. 3-2] algorithm, while the latter turns to Dykstra's algorithm [130, p. 838, Thm. 3.2] [157, §2, Thm. 4.7] (valid also for dim  $\mathcal{H} = \infty$  [62, p. 32, Thm. 2], and extendable to countable families  $\{K_i: i \in I\}$  [168, §2]). Under further restriction of  $\{K_i: i \in \{1, \ldots, n\}, n \in \mathbb{N}\}$  to a finite family of closed linear subspaces of  $\mathcal{H}$ ,  $\mathfrak{P}_{K_i}^{D_{\Psi_{\varphi_{1,1/2}}}}$  turn into orthogonal projection operators  $P_{K_i}: \mathcal{H} \to K_i$ , while Dykstra's algorithm turns into Halperin's theorem [155, Thm. 1] on strong convergence of a cyclic repetition of  $P_{K_n} \cdots P_{K_1}$  to  $P_{K_1 \cap \cdots \cap K_n}$ , i.e.

$$\lim_{k \to \infty} \left\| \left( (P_{K_n} \cdots P_{K_1})^k - P_{K_1 \cap \dots \cap K_n} \right) \xi \right\|_{\mathcal{H}} = 0 \quad \forall \xi \in \mathcal{H}.$$
 (155)

When only two projections are considered, corresponding to a composition  $\overset{\leftarrow}{\mathfrak{P}}_{K_1}^{D_{\Psi_{\varphi_{1,1/2}}}} \diamond \overset{\leftarrow}{\mathfrak{P}}_{K_2}^{D_{\Psi_{\varphi_{1,1/2}}}}$  for linear subspaces  $K_1$  and  $K_2$  of  $\mathcal{H}$ , (155) becomes the von Neumann–Kakutani theorem [340, Thm. 13.7] [189, pp. 42–44].

- b) All of above algorithms provide evaluation of the (finite or countable) left  $D_{\Psi}$ -projection  $\mathfrak{P}_{K_1 \cap \ldots \cap K_i}^{D_{\Psi}}(x)$  in terms of a norm convergence of a cyclic sequence of algorithmic steps to the unique limit point. The differences in definitions of those algorithms correspond to different ranges of generality and computational effectivity. In particular, while the direct extension on the von Neumann–Kakutani algorithm to closed convex sets converges weakly to an element in the nonempty intersection of  $K_1$  and  $K_2$  [64, Thm. 1] (Kaczmarz's algorithm [186, pp. 355–357] is a special case of this extension, obtained for hyperplanes and dim  $\mathcal{H} < \infty$ ), the limit point may be not equal to a projection onto  $K_1 \cap K_2$  [104, Fig. 2] and the norm convergence generally does not hold [167, Thm. 1] (although the latter holds always for dim  $\mathcal{H} < \infty$ , and can be guaranteed under additional conditions for dim  $\mathcal{H} = \infty$  [152, Thm. 1, Thm. 2]). On the other hand, the direct extension of Halperin's theorem to linear projections, of norm equal to 1, onto subspaces of uniformly convex Banach space is norm convergent and returns a projection, of norm equal to 1, onto an intersection [77, Thm. 2.1]. For noncyclic algorithms, see [71, 280, 20, 76, 168, 38, 42].
- (iii) If  $(X, \|\cdot\|_X)$  is separable, then  $\mathtt{lAff}(\Psi)$  has objects given by the countable sets of polynomial equations, which can be interpreted as data types, with morphisms between them interpreted as programs (algorithms). More generally, if  $(X, \|\cdot\|_X)$  is a separable Banach space, then every convex closed subset  $C \subseteq X$  is the intersection of the countable number of its supporting closed half-spaces [53, Cor. 3], i.e. it is a (countable) polyhedron, which is the set of solutions for a countable system of linear inequalities (see [60] for a discussion of the nonseparable case). Hence, also  $\mathtt{lCvx}(\Psi)$ , at least for separable  $(X, \|\cdot\|_X)$ , can be represented as a category of specific data types and computations between them.
- (iv) Functor  $\overline{\operatorname{co}_{\ell,\Psi}^{\mathrm{L}}(\cdot)}^{\ell}$  (resp.,  $\overline{\operatorname{co}_{\ell,\Psi}^{\mathrm{R}}(\cdot)}^{\ell}$ ) can be seen as implementing the following procedure: given the collection of 'raw' data sets and maps between them, produce the category of  $\ell$ -convex  $\ell$ -closed (resp.,  $\mathfrak{D}^{\mathrm{G}}\Psi \circ \ell$ -convex  $\mathfrak{D}^{\mathrm{G}}\Psi \circ \ell$ -closed) information state spaces and inferences between them, provided by left (resp., right)  $D_{\ell,\Psi}$ -projections. The construction of objects by means of these functors implements maximum absolute entropy procedure, along the lines of [134, 318, 176, 177], while the construction of morphisms corresponds to maximum relative entropy procedure, along the lines of [306, 209, 65, 97, 163].

<sup>&</sup>lt;sup>27</sup>[42, Rem. 4.5] assumes uniform convexity on bounded subsets of  $(X, \|\cdot\|_X)$ , yet it is equivalent with total convexity on bounded subsets of  $(X, \|\cdot\|_X)$  due to [87, Thm. 2.10].

- The equivalence in Corollary 3.41 may seem trivial, since it is a direct consequence of the definition of  $\bar{r}Cvx(\Psi)$ . Yet, we see it is as a top of an iceberg: currently it is an open question whether  $rCvx(\Psi)$  is a subcategory of  $\bar{r}Cvx(\Psi)$  or is it an independent structure (see [47, Ex. 7.5] for an example of  $\overline{\mathfrak{P}}_C^{D_{\Psi}}$  with convex  $\mathfrak{D}^G\Psi(C)$  and nonconvex C), the equivalence between  $LSQ(\Psi)$  and  $RSQ(\Psi)$  classes holds only under special conditions (see Proposition 2.16.(v)), and there is an important difference between availability of LSQ- vs RSQ-adaptedness in models (see Propositions 3.4 and 3.24). Furthermore, while  $\overline{\mathfrak{P}}_{L,\Psi}^{D_{\ell,\Psi}}$  for  $D_{\ell,\Psi} = D_1$  correspond to Sanov-type theorems [306, Thms. 10–13] [107, Thm. 1] [54, Thm. 2] (and, more generally, for any Csiszár–Morimoto information  $D_{\mathfrak{f}}$  [105, p. 86] [261, p. 329],  $\overline{\mathfrak{P}}_{L,\Psi}^{D_{\ell,\Psi}}$  correspond to minimum contrast (e.g., maximum likelihood) estimation [97, pp. 328–330] [98, §22] [133, §1] [19, p. 93 (Engl. rev. ed.)].
  - b) The inequality

$$\langle y - T(x), x - T(x) \rangle_{\mathcal{H}} \le 0 \ \forall (x, y) \in \mathcal{H} \times C$$
 (156)

characterises [24, p. 87] metric (=  $D_{\Psi_{q_{1,1/2}}}$ -) projections,  $T = \mathfrak{P}_C^{d_{\|\cdot\|_{\mathcal{H}}}}$  onto convex closed subsets C in Hilbert space  $\mathcal{H}$ . In general, the dichotomy between  $\overleftarrow{\mathfrak{P}}^{D_{\Psi}}$  and  $\overrightarrow{\mathfrak{P}}^{D_{\Psi}}$  can be seen as  $D_{\Psi}$ -version of the left/right split of (156) under a passage from  $\mathcal{H}$  to Banach spaces. More precisely, if  $(X, \|\cdot\|_X)$  is a Gateaux differentiable Banach space and  $\varnothing \neq C \subseteq X$  is convex and closed, then

$$[y - T(x), j(x - T(x))]_{X \times X^*} \le 0 \ \forall (x, y) \in X \times C$$
 (157)

characterises metric projections on C [122] [303, Thm. (p. 711)] [227, Eqn. (5.11)], while

$$[x - T(x), j(y - T(x))]_{X \times X^*} \le 0 \ \forall (x, y) \in X \times C$$
 (158)

characterises sunny completely  $\|\cdot\|_X$ -nonexpansive retractions<sup>28</sup> on C [288, Lemm. 2.7]. On the other hand, if  $(X, \|\cdot\|_X)$  is reflexive, Gateaux differentiable, and strictly convex, then (126) characterises left  $D_{\Psi_{\varphi_{1,1/2}}}$ -projections [10, Prop. 7.c], while, if  $(X, \|\cdot\|_X)$  is reflexive,  $\Psi$  is totally convex on efd( $\Psi$ ) and Euler-Legendre, with efd( $\Psi^{\mathbf{F}}$ ) =  $X^*$ , then right  $D_{\Psi}$ -projections are characterised as sunny quasinonexpansive  $D_{\Psi}$ -retractions [240, Cor. 4.6].

- c) This suggests us a tentative conjecture that the Euler-Legendre transform in the Vaĭnberg-Brègman setting, under a suitable choice of categories (e.g., a category of left  $D_{\Psi}$ -projections and a category of sunny quasinonexpansive right  $D_{\Psi}$ -retractions), may be an adjunction, with the above equivalence as a special case (arising as a relationship between reflective and coreflective subcategory of an above adjunction). Can this conjecture be approached via the notion of a nucleus of profunctor, as in [344, §5]?
- (vi) Regarding Proposition 3.42, dependence of  $D_{\Psi}(\phi,\cdot)$  on Q can be factored out by reducing considerations to singletons  $Q = \{\phi\}$  (understood as 0-dimensional closed affine spaces). In (some) analogy to [35, Thm. 7] [147, Thm. 4.4], this allows us to state a problem of characterisation of  $D_{\Psi}$  as a functor (or a natural transformation)  $D_{\Psi}(\phi,\cdot)$ .
- (vii) Given any  $Q \in \text{Ob}(\mathtt{ICvx}(\Psi))$ ,  $\text{Hom}_{\mathtt{ICvx}(\Psi)}(\cdot,Q)$  can be equipped with the structure of a commutative partially ordered monoid (i.e. a monoid  $(M,\square)$ , satisfying  $x\square y = y\square x \ \forall x,y \in M$ , and equipped with a partial order  $\leq$  such that  $x \leq y \Rightarrow z\square x \leq z\square y \ \forall x,y,z \in M$ ), with  $\overline{\Psi}_{Q_1}^{D_\Psi} \diamond \overline{\Psi}_{Q_2}^{D_\Psi} = \overline{\Psi}_{Q_1}^{D_\Psi}\square \overline{\Psi}_{Q_2}^{D_\Psi} := \overline{\Psi}_{Q_1}^{D_\Psi}\square_{Q_2}, \ \overline{\Psi}_{Q_1}^{D_\Psi} \leq \overline{\Psi}_{Q_2}^{D_\Psi} := Q_1 \subseteq Q_2$ , and a distinguished zero object, given by  $\overline{\Psi}_{Q}^{D_\Psi}$ . (Hence, each  $\operatorname{Hom}_{\mathtt{ICvx}(\ell,\Psi)}(\cdot,Q)$  forms a resource theory in the sense of [146, §3] (the latter generalises, in particular, the approaches of [222] and [124]).) Viewing the order of extended positive reals as a feature distinct from their composition by addition turns  $[0,\infty]$  into a commutative partially ordered monoid (with  $x+\infty:=\infty=:\infty+x \ \forall x\in[0,\infty]$ ). Thus, each functor  $D_\Psi(\phi,\cdot)$  can be seen as a morphism  $\operatorname{Hom}_{\mathtt{IAff}_Q^G(\Psi)}(\cdot,Q)\to[0,\infty]$  inside the category of commutative partially ordered monoids.

<sup>&</sup>lt;sup>28</sup>Given nonempty subsets  $K_1$  and  $K_2$  of a Banach space  $(X, \|\cdot\|_X)$ , a function  $T: K_1 \to K_2$  is called: a **retraction** iff  $T(x) = x \ \forall x \in K_2$  [55, §2]; **sunny** iff  $T(x) = y \Rightarrow T(y + t(x - y)) = y \ \forall x \in K_1 \ \forall t \geq 0$  [132, p. 19].

- (viii) The extension from the monoid structure of the composable sets  $LSQ(\Psi, K)$  and  $RSQ(\Psi, K)$  to the corresponding categories  $LSQ_{cvx}^{\subseteq}(\Psi, K)$  and  $RSQ_{cvx}^{\subseteq}(\Psi, K)$  (which depends on the associativity of composition) is possible due to an observation that the proofs of [289, Lemm. 1, Lemm. 2] and [241, Prop. 3.3, Prop. 4.4, Fact 6.5, Prop. 6.6] do not depend on the action of  $T_i$  on the domain  $K \setminus ran(T_{i-1})$  for  $i \in \{2, ..., m\}$ . Hence, these results hold in larger generality, namely for m-tuples of maps  $(T_1: K \to K, T_2: ran(T_1) \to K, T_3: ran(T_2) \to K, ..., T_m: ran(T_{m-1}) \to K)$ .
  - (ix) The restriction of considerations from the category  $\mathtt{RSQ}^\subseteq_{\mathsf{cvx}}(\ell, \Psi)$  (with objects given by any nonempty subsets of  $\mathsf{int}(\mathsf{efd}(\Psi))$ ) to  $\bar{\mathtt{RSQ}}^\subseteq_{\mathsf{cvx}}(\ell, \Psi)$ , as exhibited in Definitions 3.43 and 3.44, Proposition 3.45, and Corollary 3.46, is due to requirement of compatibility with  $\bar{\mathtt{rCvx}}(\ell, \Psi)$ , as well as with the use of Proposition 2.16.(v). Thus, the discussion in (v) above applies, mutatis mutandis, to  $\bar{\mathtt{RSQ}}^\subseteq_{\mathsf{cvx}}(\ell, \Psi)$ .
  - Under the additional assumptions on Ψ provided by Proposition 3.3, and assuming norm-to-norm continuity of  $\ell$ , we obtain the categories  $\mathbf{1Cvx}_{\mathrm{cont}}(\ell,\Psi)$  and  $\bar{\mathbf{r}Cvx}_{\mathrm{cont}}(\ell,\Psi)$  of norm-to-norm continuous left and right  $D_{\ell,\Psi}$ -projections, respectively. By Proposition 3.23, if  $\Psi = \Psi_{\varphi}$  for a gauge  $\varphi$ , then the above assumptions on Ψ are equivalent with assuming that  $(X, \|\cdot\|_X)$  is reflexive, strictly convex, Fréchet differentiable, and has the Radon–Riesz–Shmul'yan property. Analogously, Corollary 3.7 leads to the category  $\mathbf{1Cvx}_{\mathrm{LH},X}^{s/(r-1)}(\Psi)$  (resp.,  $\bar{\mathbf{r}Cvx}_{\mathrm{LH},X}^{s^2w/(r-1)}(\Psi)$  of  $\frac{s}{r-1}$ (resp.,  $\frac{s^2w}{r-1}$ )-Lipschitz–Hölder continuous left (resp., right)  $D_{\ell,\Psi}$ -projections on X, while Proposition 3.29 leads to the category  $\mathbf{1Cvx}_{\mathrm{LH},X}^{\beta(r-1)/(1-\beta)}(\Psi_{\varphi_{1,\beta}})$  (resp.,  $\bar{\mathbf{r}Cvx}_{\mathrm{LH},\text{bound}(X)}^{(1-\beta)^2(r-1)^2/\beta^2}(\Psi_{\varphi_{1,\beta}})$ ) of  $\frac{\beta(r-1)}{1-\beta}$ (resp.,  $\frac{(1-\beta)^2(r-1)^2}{\beta^2}$ )-Lipschitz–Hölder continuous left (resp., right)  $D_{\Psi_{\varphi_{1,\beta}}}$ -projections on X (resp., bounded subsets of X).

## 4.1 $X = L_{1/\gamma}$ space, $\ell = \text{Mazur map}, \Psi = \Psi_{\varphi}$

**Proposition 4.1.** Let  $\mathcal{N}$  be a  $W^*$ -algebra,  $\varphi$  a gauge,  $\gamma \in ]0,1[$ ,  $\lambda \in ]0,\infty[$ ,  $\varnothing \neq C \subseteq \mathcal{N}_{\star}$ ,  $\mathcal{B}$  a ball in  $\mathcal{N}_{\star}$  (e.g.,  $\mathcal{B} = B(\mathcal{N}_{\star}, \|\cdot\|_1)$ ). Then:

- (i)  $D_{\lambda\ell_{\gamma},\Psi_{\varphi}}: \mathcal{N}_{\star} \times \mathcal{N}_{\star} \to [0,\infty]$  is an information on  $\mathcal{N}_{\star}$ ;
- (ii) if C is  $\lambda \ell_{\gamma}$ -convex  $\lambda \ell_{\gamma}$ -closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is left pythagorean on C,  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent, and adapted;
- (iii) if  $C \subseteq \mathcal{N}_{\star}^+ \cup \mathcal{B}$  is  $\lambda \ell_{\gamma}$ -convex closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is left pythagorean on C,  $\mathfrak{F}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent, adapted, and norm-to-norm continuous in  $\mathcal{N}_{\star}$ , and  $\inf_{y \in C} \{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}(y, \cdot)\}$  is continuous on  $\mathcal{N}_{\star}$ ;
- (iv) if C is  $\lambda \ell_{1-\gamma}$ -convex  $\lambda \ell_{1-\gamma}$ -closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent, and adapted;
- (v) if  $C \subseteq \mathcal{N}_{\star}^+ \cup \mathcal{B}$  is  $\lambda \ell_{1-\gamma}$ -convex closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent, adapted, and norm-to-norm continuous in  $\mathcal{N}_{\star}$ ;
- (vi) the sets  $LSQ(\lambda \ell_{\gamma}, \Psi_{\varphi}, C)$  and  $RSQ(\lambda \ell_{\gamma}, \Psi_{\varphi}, C)$  are composable;
- (vii) the categories  $1\text{Cvx}^\subseteq(\lambda\ell_\gamma,\Psi_\varphi)$ ,  $\bar{\mathbf{r}}\text{Cvx}^\subseteq(\lambda\ell_\gamma,\Psi_\varphi)$ ,  $LSQ_{\mathrm{cvx}}^\subseteq(\lambda\ell_\gamma,\Psi_\varphi)$ , and  $\bar{\mathtt{R}}SQ_{\mathrm{cvx}}^\subseteq(\lambda\ell_\gamma,\Psi_\varphi)$  satisfy the functorial adjunctions and equivalences given by Corollary 3.46.(i)–(ii) with  $Z=\mathcal{N}_\star$ .

Proof. Since int(efd(Ψ<sub>φ</sub>)) =  $L_{1/\gamma}(\mathcal{N})$ , we have  $(\lambda \ell_{\gamma})^{-1}$ (int(efd(Ψ<sub>φ</sub>))) =  $\mathcal{N}_{\star}$ . Zone consistency of left and right  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$ -projections follows from Proposition 3.15.(iv). For any  $\gamma \in ]0, 1[$ ,  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  is uniformly convex (as proved for  $\gamma \in ]0, \frac{1}{2}]$  in [127, Lemm. 5] and for  $\gamma \in ]0, 1[$  in [103, Cor. 2.1]<sup>29</sup> in type I case, for  $\gamma \in ]0, 1[$  in [358, Lemm. 3.12, Lemm. 3.22, p. 262], for  $\gamma \in ]0, 1[$  in [22, Prop. 8.2, Lemm. 9.1] and [203, Thm. 4.2] in countably finite case, for  $\gamma \in ]0, \frac{1}{2}]$  in [202, Lemm. 3.4.2.(i)] [322, Prop. 31] (cf. [153, Lemm. 1.18]) [162, Lemm. 9] and for  $\gamma \in ]0, 1[$  in [243, Lemm. 8.1, 8.2] [137, Thm. 5.3] in general case), hence uniformly Fréchet differentiable (due to  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})^* \cong (L_{1/(1-\gamma)}(\mathcal{N}), \|\cdot\|_{1/(1-\gamma)})$  ∀γ ∈ ]0, 1[, proved in [307, p. 580] in type I case, [127, Thm. 7] and [352, Thm. 4.2] in semifinite case, and in [202, Thm. 3.4.3] [162, Thm. 10.(2)] [322, Thm. 32.(2)] (cf. [153, Thm. 1.19]) in

<sup>&</sup>lt;sup>29</sup>[249, Thm. 2.7] is often cited in this case, however its proof is incorrect (see [137, p. 299]).

general case). Since uniform convexity entails both strict convexity and the Radon-Riesz-Shmul'yan property, while uniform Fréchet differentiability entails (Fréchet differentiability and thus) Gateaux differentiability,  $\Psi_{\varphi}$  is Euler-Legendre on any  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  by means of Proposition 3.12, and is left (resp., right) pythagorean on convex closed (resp.,  $\mathfrak{D}^{G}\Psi_{\varphi}$ -convex  $\mathfrak{D}^{G}\Psi_{\varphi}$ -closed)  $K = \lambda \ell_{\gamma}(C)$  by means of Proposition 3.15. By Proposition 2.25.(iv), Fréchet differentiability of  $(X, \|\cdot\|_{X})$  is equivalent with norm-to-norm continuity of  $j_{\varphi}$  for any gauge  $\varphi$ . Furthermore, for any  $\gamma \in ]0,1[$ ,  $\ell_{\gamma}$  is a norm-to-norm homeomorphism from the positive cone of  $(\mathcal{N}_{\star}, \|\cdot\|_{1})$  to the positive cone of  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  [204, Thm. 4.2], and a uniform homeomorphism from any ball in  $\mathcal{N}_{\star}$  [285, Lemm. 3.2]. Since  $\lambda$  is a multiplicative constant, the same conclusion follows for  $\lambda \ell_{\gamma}$ . Since  $\mathfrak{D}^{G}\Psi_{\varphi}$ -convexity is a convexity in  $L_{1/(1-\gamma)}(\mathcal{N})$ , while  $j_{\varphi} = \mathfrak{D}^{G}\Psi_{\varphi}$  is norm-to-norm continuous,  $(\mathfrak{D}^{G}\Psi_{\varphi} \circ \lambda \ell_{\gamma})$ -convex  $(\mathfrak{D}^{G}\Psi_{\varphi} \circ \lambda \ell_{\gamma})$ -closed sets in  $\mathcal{N}_{\star}$  coincide with  $\lambda \ell_{1-\gamma}$ -convex  $\lambda \ell_{1-\gamma}$ -closed sets in  $\mathcal{N}_{\star}$ . Since uniform convexity implies also the Radon-Riesz-Shmul'yan property [314, Thm. 5], the rest follows from Proposition 3.23.(vi), as well as adaptedness in (ii) and (v), follow from Proposition 3.24.

**Proposition 4.2.** For  $\varphi = \varphi_{\alpha,\beta}$ ,  $\alpha \in ]0,\infty[$ ,  $\beta \in ]0,1[$ ,  $\lambda \in ]0,\infty[$ , any  $W^*$ -algebra  $\mathcal{N}$ , and  $\phi,\psi \in \mathcal{N}_{\star}$ ,

$$D_{\lambda \ell_{\gamma}, \Psi_{\varphi_{\alpha,\beta}}}(\phi, \psi) = \frac{\lambda^{1/\beta}}{\alpha} \left( \beta \|\phi\|_{1}^{\gamma/\beta} + (1-\beta) \|\psi\|_{1}^{\gamma/\beta} - \|\psi\|_{1}^{\gamma(\frac{1}{\beta} - \frac{1}{\gamma})} \operatorname{re} \int u_{\phi} |\phi|^{\gamma} u_{\psi} |\psi|^{1-\gamma} \right). \tag{159}$$

*Proof.* By a direct calculation from the formula (124), using [204, Lemm. 3.1] and  $L_{1/\gamma}(\mathcal{N}) \ni x \mapsto j(x) = \|x\|_{1/\gamma}^{2-1/\gamma} u_x |x|^{1/\gamma-1} \in L_{1/(1-\gamma)}(\mathcal{N})$ , the latter following from [322, Prop. 24] [162, p. 162] (cf. also [180, Eqn. (11)]).

Corollary 4.3. For  $\varphi = \varphi_{\alpha,\beta}$ ,  $\alpha \in ]0,\infty[$ ,  $\beta \in ]0,1[$ ,  $\lambda \in ]0,\infty[$ , any  $W^*$ -algebra  $\mathcal{N}$ , and  $\phi,\psi \in \mathcal{N}_{\star}$ ,

- (i)  $D_{\lambda\ell_{\gamma},\Psi_{\varphi_{\alpha,\beta}}} = D_{\ell_{\gamma},\Psi_{\varphi_{\alpha\lambda}-1/\beta,\beta}}$ .
- (ii) In particular, setting  $\lambda = 1$ ,  $\beta = \gamma$ ,  $\alpha = \gamma(1 \gamma)$ , we obtain  $\varphi_{\gamma(1-\gamma),\gamma}(t) = \frac{1}{\gamma(1-\gamma)}t^{1/\gamma-1}$ ,  $\Psi_{\varphi_{\gamma(1-\gamma),\gamma}}(x) = \frac{1}{1-\gamma}\|x\|_{1/\gamma}^{1/\gamma}$ , and

$$D_{\ell_{\gamma},\Psi_{\varphi_{\gamma(1-\gamma),\gamma}}}(\phi,\psi) = D_{\frac{1}{\gamma}\ell_{\gamma},\Psi_{\varphi_{\gamma^{1-1/\gamma}(1-\gamma),\gamma}}}(\phi,\psi)$$

$$= \frac{1}{1-\gamma} \|\phi\|_{1} + \frac{1}{\gamma} \|\psi\|_{1} + \frac{1}{\gamma(1-\gamma)} \operatorname{re} \int u_{\phi} |\phi|^{\gamma} u_{\psi} |\psi|^{1-\gamma} =: D_{\gamma}(\phi,\psi).$$
 (161)

(iii)  $\operatorname{CPTP}(\mathcal{N}_{\star}) \subseteq \operatorname{CN}(\ell_{\gamma}, \Psi_{\varphi_{\gamma(1-\gamma),\gamma}})$ , where  $\operatorname{CPTP}(\mathcal{N}_{\star})$  denotes the set of completely positive trace-preserving maps from  $\mathcal{N}_{\star}$  to  $\mathcal{N}_{\star}$ .

*Proof.* (i) follows directly from (159), while (ii) is a special case of (ii). (iii) follows from (ii), combined with the result [180, (ii) (p. 288)] obtained for  $D_{\gamma}$  on  $\mathcal{N}_{\star}$ .

**Proposition 4.4.** Let  $\mathcal{N}$  be a  $W^*$ -algebra,  $\varnothing \neq K \subseteq L_{1/\gamma}(\mathcal{N}), \varnothing \neq C \subseteq B(\mathcal{N}_{\star}, \|\cdot\|_1)$ . Then:

- (i) if  $\gamma \in [\frac{1}{2}, 1[$  and  $\beta \in ]0, \frac{1}{2}]$ , K is convex and closed (resp., C is  $\ell_{\gamma}$ -convex and closed), then  $\stackrel{\longleftarrow}{\mathfrak{P}}_{K}^{D_{\psi_{\varphi_{1},\beta}}}$  (resp.,  $\stackrel{\longleftarrow}{\mathfrak{P}}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1},\beta}}}$ ) is uniformly continuous on bounded subsets of  $L_{1/\gamma}(\mathcal{N})$  (resp.,  $\ell_{\gamma}$ -bounded subsets of  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ ), and  $\frac{\beta(\gamma-1)}{1-\beta}$ -(resp.,  $\frac{\beta(\gamma-1)\gamma}{1-\beta}$ -)Lipschitz-Hölder continuous on  $L_{1/\gamma}(\mathcal{N})$  (resp.,  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ );
- (ii) if  $\gamma \in ]0, \frac{1}{2}[$  and  $\beta \in ]0, \gamma]$ , K is convex and closed (resp., C is  $\ell_{\gamma}$ -convex and closed), then  $\mathfrak{P}_{K}^{D_{\Psi_{\varphi_{1},\beta}}}$  (resp.,  $\mathfrak{P}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1},\beta}}}$ ) is uniformly continuous on bounded subsets of  $L_{1/\gamma}(\mathcal{N})$  (resp.,  $\ell_{\gamma}$ -bounded subsets of  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ ) and  $\frac{\beta}{1-\beta}$ -(resp.,  $\frac{\beta\gamma}{1-\beta}$ -)Lipschitz-Hölder continuous on  $L_{1/\gamma}(\mathcal{N})$  (resp.,  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ );
- (iii) if  $\gamma \in [\frac{1}{2}, 1[$  and  $\beta \in [\gamma, 1[$ ,  $j_{\varphi_{1,\gamma}}(K)$  is convex and closed (resp., C is  $(j_{\varphi_{1,\gamma}} \circ \ell_{\gamma})$ -convex and closed), then  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}$  (resp.,  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}}$ ) is  $(\frac{1-\beta}{\beta})^2$ -(resp.,  $\gamma(\frac{1-\beta}{\beta})^2$ -)Lipschitz-Hölder continuous on bounded subsets of  $L_{1/\gamma}(\mathcal{N})$  (resp.,  $\ell_{\gamma}$ -bounded subsets of  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ );

 $\begin{array}{l} (iv) \ \ if \ \gamma \in \ ]0,\frac{1}{2}] \ \ and \ \beta \in \ [\frac{1}{2},1[,\ j_{\varphi_{1,\beta}}(K)\ \ is\ convex\ \ and\ \ closed\ \ (resp.,\ C\ \ is\ (j_{\varphi_{1,\beta}}\circ \ell_{\gamma})\text{-}convex\ \ and\ \ closed),\\ then \ \ \overrightarrow{\mathfrak{P}}_{K}^{D_{\Psi\varphi_{1,\beta}}}\ \ \ (resp.,\ \overrightarrow{\mathfrak{P}}_{C}^{\ell_{\ell_{\gamma},\Psi\varphi_{1,\beta}}})\ \ is\ \ (\frac{(1-\beta)\gamma}{\beta(1-\gamma)})^{2}\text{-}(resp.,\ \gamma^{3}(\frac{(1-\beta)}{\beta(1-\gamma)})^{2}\text{-})Lipschitz-H\"{o}lder\ \ continuous\\ on\ \ bounded\ \ subsets\ \ of\ L_{1/\gamma}(\mathcal{N})\ \ \ (resp.,\ \ell_{\gamma}\text{-}bounded\ \ subsets\ \ of\ B(\mathcal{N}_{\star},\|\cdot\|_{1})). \end{array}$ 

Proof. Clarkson inequality for  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  spaces ([102, Thm. 2] for commutative  $\mathcal{N}$ , [103, Cor. 2.1] for type I  $\mathcal{N}$ , [358, Lemm. 3.21, Lemm. 3.22, p. 262] for semifinite  $\mathcal{N}$ , [203, Prop. 5.3] for countably finite  $\mathcal{N}$ , [137, Thm. 5.3] for general  $\mathcal{N}$ ) implies: if  $\gamma \in ]0, \frac{1}{2}]$ , then  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  is  $\frac{1}{\gamma}$ -uniformly convex and  $\frac{1}{1-\gamma}$ -uniformly Fréchet differentiable. Furthermore, if  $\gamma \in [\frac{1}{2}, 1[$ , then  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  is 2-uniformly convex ([156, Rem. (p. 244)] [187, Eqn. (10a)–(10b)] for commutative  $\mathcal{N}$ , [323, Thm. 2.2] for type I  $\mathcal{N}$ , [36, Thm. 1, p. 466] for semifinite  $\mathcal{N}$ , [278, Thm. 5.3] for general  $\mathcal{N}$ ), hence  $(L_{1/(1-\gamma)}(\mathcal{N}), \|\cdot\|_{1/(1-\gamma)})$  is 2-uniformly Fréchet differentiable. Thus,  $(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  is  $\max\{2, \frac{1}{\gamma}\}$ -uniformly convex and  $\min\{2, \frac{1}{\gamma}\}$ -uniformly Fréchet differentiable  $\forall \gamma \in ]0, 1[$ . Combining this with Proposition 3.29, and with the fact that  $r_1$ -uniform convexity (resp.,  $r_1$ -uniform Fréchet differentiability) implies  $r_2$ -uniform convexity (resp.,  $r_2$ -uniform Fréchet differentiability) for  $2 \leq r_1 \leq r_2 < \infty$  (resp.,  $1 < r_2 \leq r_1 \leq 2$ ) (cf., e.g., [351, Prop. 2.1, Prop. 2.2.(iii)] for a proof), we obtain the statements for left and right  $D_{\ell_{\gamma},\Psi_{\varphi}}$ -projections follow from Lipschitz continuity of  $(\ell_{\gamma})^{-1}$  on  $B(L_{1/\gamma}(\mathcal{N}), \|\cdot\|_{1/\gamma})$  and  $\gamma$ -Lipschitz-Hölder continuity of  $\ell_{\gamma}$  on  $B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ , for any  $\gamma \in ]0, 1[$  [295, Thm. (p. 37)].

**Proposition 4.5.** Let A be a semifinite JBW-algebra,  $\tau$  a faithful normal semifinite trace on A,  $\gamma \in ]0, 1[$ ,  $\lambda \in ]0, \infty[$ . Then  $\lambda \ell_{\gamma}$  is a norm-to-norm homeomorphism between  $(A_{\star}, \|\cdot\|_{1})^{+}$  and  $(L_{1/\gamma}(A, \tau), \|\cdot\|_{1/\gamma})^{+}$ .

- Proof. 1) Consider  $x \in A_{\star}^+$  and a sequence  $\{x_n \in A_{\star}^+ : n \in \mathbb{N}\}$  such that  $\lim_{n \to \infty} \|x_n x\|_1 = 0$ . From inequality  $\|x^{\gamma} y^{\gamma}\|_{1/\gamma}^{1/\gamma} \leq \|x y\|_1 \ \forall x, y \in A_{\star}^+$  [170, Prop. 9.(ii)] it follows that  $\lim_{n \to \infty} \|x_n^{\gamma} x^{\gamma}\|_{1/\gamma}^{1/\gamma} = 0$ , i.e.  $\lim_{n \to \infty} \|\ell_{\gamma}(x_n) \ell_{\gamma}(x)\|_{1/\gamma} = 0$ .
  - 2) The uniform convexity of  $(L_{1/\gamma}(A,\tau), \|\cdot\|_{1/\gamma})$ , proved in [169, Thm. V.3.2] for  $\gamma \in ]0, \frac{1}{2}]$  and in [31, Thm. 2.5] and [170, Cor.12, Cor. 13] for  $\gamma \in ]0, 1[$ , taken together with the duality [1, Thm. 2.1.10] [169, Thm. V.3.2]

$$(L_{1/\gamma}(A,\tau), \|\cdot\|_{1/\gamma})^* \cong (L_{1/(1-\gamma)}(A,\tau), \|\cdot\|_{1/(1-\gamma)}) \ \forall \gamma \in ]0,1[,$$
(162)

implies uniform Fréchet differentiability of  $(L_{1/\gamma}(A,\tau),\|\cdot\|_{1/\gamma})$ , which in turn implies its Fréchet differentiability. Taking  $\varphi(t)=t^{1/\gamma-1}$  (i.e.  $\varphi_{1,\beta}$  with  $\beta=\gamma$ ), corresponding to  $[\![x,j_{\varphi}(x)]\!]_{L_{1/\gamma}(A,\tau)\times L_{1/(1-\gamma)}(A,\tau)}$   $\|x\|_{1/\gamma}^{1/\gamma}$  and  $\|j_{\varphi}(x)\|_{1/(1-\gamma)}=\|x\|_{1/\gamma}^{1/\gamma-1}$ , gives norm-to-norm continuity of

$$j_{\varphi}: L_{1/\gamma}(A,\tau) \ni x = s_x \bullet |x| \mapsto s_x \bullet |x|^{1/\gamma - 1} \in L_{1/(1-\gamma)}(A,\tau). \tag{163}$$

(The above expression for  $j_{\varphi}$  can be explicitly deduced by noticing that the formula  $\|x\|_{1/\gamma}^{1-1/\gamma}s_x \bullet |x|^{1/\gamma-1}$  [1, p. 51] [169, Lemm. V.3.3.2°] (cf. [31, p. 101] and [170, p. 420]) equals to  $\mathfrak{D}^F \|x\|_{1/\gamma}$  by [170, Lemm. 14]. Then, using the general formulas  $j(x) = \frac{1}{2}\mathfrak{D}^F(\|x\|_X^2) = \|x\|_X\mathfrak{D}^F \|x\|_X$  and  $j_{\varphi}(x) = \|x\|_X^{-1}\varphi(\|x\|_X)j(x)$ , valid for any gauge  $\varphi$  and any Fréchet differentiable  $(X, \|\cdot\|_X)$ , we obtain  $j(x) = \|x\|_{1/\gamma}^{2-1/\gamma}s_x \bullet |x|^{1/\gamma-1}$  and  $j_{\varphi}(x) = s_x \bullet |x|^{1/\gamma-1}$  for  $\varphi(t) = t^{1/\gamma-1}$  and  $(X, \|\cdot\|_X) = (L_{1/\gamma}(A,\tau), \|\cdot\|_{1/\gamma})$ .) The latter, taken together with the nonassociative Rogers–Hölder inequality  $\|xy\|_1 \leq \|x\|_{1/\gamma} \|y\|_{1/(1-\gamma)} \ \forall x, y \in A_\tau$  [1, Lemm. 2.1.1.(a)] [169, Lemm. V.3.3.1°] (cf. [31, Prop. IV.2.4.(i)] and [170, Lemm. 3.(i)]), entails norm-to-norm continuity of  $j_{\varphi}(x) \bullet x = x^{1/\gamma-1} \bullet x = x^{1/\gamma} \ \forall x \in L_{1/\gamma}(A,\tau)^+$ .

3) Since  $\lambda$  is a multiplicative positive constant, the above reasoning follows from  $\ell_{\gamma}$  to  $\lambda \ell_{\gamma}$ .

**Proposition 4.6.** Let A be a semifinite JBW-algebra,  $\tau$  a faithful normal semifinite trace on A. If  $\gamma \in [\frac{1}{2}, 1[$ , then  $(L_{1/\gamma}(A, \tau), \|\cdot\|_{1/\gamma})$  is 2-uniformly convex and  $\frac{1}{\gamma}$ -uniformly Fréchet differentiable.

*Proof.*  $\frac{1}{1-\gamma}$ -uniform convexity and  $\frac{1}{\gamma}$ -uniform Fréchet differentiability of  $L_{1/\gamma}(A,\tau)$  for  $\gamma \in [\frac{1}{2},1[$  is established explicitly in [31, p. 102] and [170, p. 427]. 2-uniform convexity follows from the inequality [36, Thm. 1, p. 466] [278, Thm. 5.3]

$$||x||_{1/\gamma}^2 + \left(\frac{1}{\gamma} - 1\right) ||y||_{1/\gamma}^2 \le \left(\frac{1}{2} \left(||x + y||_{1/\gamma}^{1/\gamma} + ||x - y||_{1/\gamma}^{1/\gamma}\right)\right)^{2\gamma} \quad \forall x, y \in L_{1/\gamma}(\mathcal{N}), \tag{164}$$

for any W\*-algebra  $\mathcal{N}$ , taken together with an extension of the Shirshov-Cohn theorem to semifinite JBW-algebras with weights [31, Rem. (p. 94)].

**Proposition 4.7.** Let A be a semifinite JBW-algebra,  $\tau$  a faithful normal semifinite trace on A,  $\varphi$  a gauge,  $\gamma \in ]0,1[$ ,  $\lambda \in ]0,\infty[$ ,  $\varnothing \neq C \subseteq A_{\star}$ . Then:

- (i)  $D_{\lambda\ell_{\gamma},\Psi_{\varphi}}: A_{\star} \times A_{\star} \to [0,\infty]$  is an information on  $A_{\star}$ , independent of the choice of  $\tau$ ;
- (ii) the sets LSQ( $\lambda \ell_{\gamma}, \Psi_{\varphi}, C$ ) and RSQ( $\lambda \ell_{\gamma}, \Psi_{\varphi}, C$ ) are composable;
- (iii) if C is  $\lambda \ell_{\gamma}$ -convex  $\lambda \ell_{\gamma}$ -closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is left pythagorean on C, and  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent and adapted;
- (iv) if C is  $\lambda \ell_{1-\gamma}$ -convex  $\lambda \ell_{\gamma}$ -closed, then  $D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}$  is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is zone consistent and adapted;
- (v) if  $C \subseteq A_{\star}^+$  is  $\lambda \ell_{\gamma}$ -convex closed, then (iii) holds,  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}}$  is norm-to-norm continuous in  $A_{\star}^+$  (with respect to  $\|\cdot\|_1$ ), and  $\inf_{y \in C} \{D_{\lambda \ell_{\gamma}, \Psi_{\varphi}}(y, \cdot)\}$  is continuous on  $A_{\star}^+$  (with respect to  $\|\cdot\|_1$ );
- (vi) if  $C \subseteq A_{\star}^+$  is  $\lambda \ell_{1-\gamma}$ -convex closed, then (iv) holds, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\lambda \ell_{\gamma},\Psi_{\varphi}}}$  is norm-to-norm continuous in  $A_{\star}^+$  (with respect to  $\|\cdot\|_1$ );
- (vii) the categories  $\mathtt{ICvx} \subseteq (\lambda \ell_{\gamma}, \Psi_{\varphi})$ ,  $\overline{\mathtt{rCvx}} \subseteq (\lambda \ell_{\gamma}, \Psi_{\varphi})$ ,  $\mathtt{LSQ}_{\mathtt{cvx}} \subseteq (\lambda \ell_{\gamma}, \Psi_{\varphi})$ , and  $\overline{\mathtt{RSQ}}_{\mathtt{cvx}} \subseteq (\lambda \ell_{\gamma}, \Psi_{\varphi})$  satisfy the functorial adjunctions and equivalences given by Corollary 3.46.(i)–(ii) with  $Z = A_{\star}$ .

Proof. Due to uniform convexity and uniform Fréchet differentiability of  $(L_{1/\gamma}(A,\tau), \|\cdot\|_{1/\gamma})$ ,  $\gamma \in ]0,1[$ , Proposition 3.12 implies that  $\Psi_{\varphi}$  is Euler–Legendre on  $(L_{1/\gamma}(A,\tau), \|\cdot\|_{1/\gamma})$ , while Proposition 3.15 implies that  $D_{\Psi_{\varphi}}$  is an information. The proof that  $D_{\lambda\ell_{\gamma},\Psi_{\varphi}}$  is left (resp., right) pythagorean on  $\lambda\ell_{\gamma}$ -convex (resp.,  $\lambda\ell_{1-\gamma}$ -convex) closed sets C is exactly the same as in the proof of Proposition 4.1. By [32, Cor. 1] (cf. also [33, Cor. 2] with the choice of an N-function  $\Upsilon(t) = \gamma |t|^{1/\gamma}$ ),  $(L_{1/\gamma}(A,\tau_1), \|\cdot\|_{1/\gamma})$  and  $(L_{1/\gamma}(A,\tau_2), \|\cdot\|_{1/\gamma})$  are isometrically isomorphic for any two faithful normal semifinite traces  $\tau_1$  and  $\tau_2$  on A, with  $\gamma \in ]0,1[$ . Hence,  $D_{\lambda\ell_{\gamma},\Psi_{\varphi}}$  does not depend on the choice of  $\tau$ . The rest follows from Propositions 4.5, [206, Prop. 4.6], 3.23, and 3.24 in the same way as in Proposition 4.1.

Corollary 4.8. Let A be a semifinite JBW-algebra with a faithful normal semifinite trace  $\tau$ . Then all of the statements of Proposition 4.4.(i)–(x) on uniform and Lipschitz–Hölder continuity of  $\mathfrak{F}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}$  and  $\mathfrak{F}_{K}^{D_{\Psi_{\varphi_{1,\beta}}}}$  (resp.,  $\mathfrak{F}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}}$  and  $\mathfrak{F}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}}$ ) hold for  $\varnothing \neq K \subseteq L_{1/\gamma}(\mathcal{N})$  (resp.,  $\varnothing \neq C \subseteq B(\mathcal{N}_{\star}, \|\cdot\|_{1})$ ) replaced by  $\varnothing \neq K \subseteq L_{1/\gamma}(A, \tau)$  (resp.,  $\varnothing \neq C \subseteq (B(A_{\star}, \|\cdot\|_{1}))^{+}$ ).

*Proof.* Follows from Propositions 3.29, [206, Prop. 4.6], and 4.6, directly along the lines of the proof of Proposition 4.4.

- Remark 4.9. (i) Identification of  $D_{\gamma}$  as  $D_{\ell_{\gamma},\Psi_{\varphi_{\gamma}(1-\gamma),\gamma}}$ , provided in Corollary 4.3, is new. The right hand side of Equation (160) corresponds to  $D_{\Psi_{\varphi}}$  with  $\varphi(t) = \frac{1}{1-\gamma}(\gamma t)^{1/\gamma-1}$ . Up to reformulation in weight-independent terms, provided in [205, Eqn. (41)], the formula (161) was obtained in [180, §8] (cf. also [268, Eqn. (42)]) as  $D_{\Psi}(\frac{1}{\gamma}\ell_{\gamma}(\phi), \frac{1}{\gamma}\ell_{\gamma}(\psi))$  with  $\Psi$  equal to  $\Psi_{\varphi_{\gamma^{1-1/\gamma}(1-\gamma),\gamma}}$  (however, it was not identified there as an example of  $\Psi_{\varphi}$ , although the corresponding  $D_{\Psi}$  was explicitly identified as a Vaĭnberg–Brègman functional). Proposition 4.1.(ii) provides a generalisation of [180, Prop. 8.1.(i)–(ii), Prop. 8.2.(ii)] to  $\Psi_{\varphi}$  with any gauge  $\varphi$ .
  - (ii) Another special case of  $D_{\Psi_{\varphi_{\alpha,\beta}}}(x,y)$  on  $L_{1/\gamma}(\mathcal{N})$  spaces, with  $\alpha=1,\ \beta=\frac{1}{2},\ \gamma\in ]0,1[$ , and  $\mathcal{N}$  limited to type  $I_n$  W\*-algebras, was considered in [265, p. 377]. For  $\gamma=\frac{1}{2}$ , and for any W\*-algebra  $\mathcal{N}$ , they are also a special case of  $4D_{\Psi_{\varphi_{\gamma(1-\gamma),\gamma}}}(x,y)=D_{4\Psi_{\varphi_{\gamma(1-\gamma),\gamma}}}(x,y)$ , and take the form  $2\|x-y\|_{L_2(\mathcal{N})}$ .

(iii) Plugging the formula for  $j: L_{1/\gamma}(A, \tau) \to L_{1/(1-\gamma)}(A, \tau)$  from the proof of Proposition 4.5 into the equation (124), we obtain a family belonging to the class  $D_{\ell_{\gamma},\Psi_{\varphi}}$  on  $A_{\star}$ , which is a nonassociative analogue of (159), with  $(\lambda, \alpha, \beta, \gamma) \in ]0, \infty[^2 \times ]0, 1[^2 \text{ and } \phi, \psi \in A_{\star}$ :

$$D_{\lambda\ell_{\gamma},\Psi_{\varphi_{\beta}}}(\phi,\psi) = \frac{\lambda^{1/\beta}}{\alpha} \left( \beta(\tau(\phi))^{\gamma/\beta} + (1-\beta)(\tau(\psi))^{\gamma/\beta} - (\tau(\psi))^{\gamma/\beta-1} \tau((s_{\phi} \bullet |\phi|^{\gamma}) \bullet (s_{\psi} \bullet |\psi|^{1-\gamma})) \right), \tag{165}$$

When restricted to  $\phi, \psi \in A_{\star}^+$ , corresponding to  $s_{\phi} = \mathbb{I} = s_{\psi}$ , (165) satisfies the conditions of Proposition 4.7.(v) and 4.7.(vi).

- (iv) Since Corollary 4.3.(i) applies to (165) as well, in what follows we will set  $\lambda = 1$  in both JBW- and W\*-algebraic cases.
- (v) Since [285, Lemm. 3.2] establishes *local* uniform homeomorphy of  $\ell_{\gamma}$  on  $(\mathcal{N}_{\star}, \|\cdot\|_{1})$ , the statements about uniform continuity of  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}}$  and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{\gamma},\Psi_{\varphi_{1,\beta}}}}$  in Proposition 4.4 hold for  $\ell_{\gamma}$ -bounded subsets of any closed ball in  $\mathcal{N}_{\star}$  (this variant was explicitly used in Proposition 4.1).
- (vi) Propositions 4.1.(i) and 4.7.(i), 4.1.(ii)–(iii) and 4.7.(iii) in their part on left pythagoreanity and zone consistency, as well as 4.1.(iv)–(v) and 4.1.(iv) in their part on right pythagoreanity and zone consistency hold also under replacing a gauge  $\varphi$  by a quasigauge  $\varphi$ , provided the latter satisfies the respective conditions of Proposition 3.22.
- (vii) For an arbitrary W\*-algebra  $\mathcal{N}$  and  $\gamma_1, \gamma_2 \in ]0, \infty[$ , the noncommutative Mazur map,

$$\ell_{\gamma_1, \gamma_2} : L_{1/\gamma_1}(\mathcal{N}) \ni x = u_x |x| \mapsto u_x |x|^{\gamma_2/\gamma_1} \in L_{1/\gamma_2}(\mathcal{N}),$$
 (166)

has appeared implicitly in [153, Prop. 1.9] (cf. [322, Prop. 12]), and then explicitly in [204, Thm. 4.2] (with  $u_x = \mathbb{I}$  and  $\gamma_1, \gamma_2 \in ]0, 1]$ ) and [285, p. 58] (in full generality). In commutative case, this map has been introduced in [246, p. 83]. As proved independently in [3, Thm. 4.5, Rem. 4.3] (for semifinite  $\mathcal{N}$  and  $\gamma_1, \gamma_2 \in ]0, 1[$ ) and [295, Thm. (p. 37)] (for any  $\mathcal{N}$  and  $\gamma_1, \gamma_2 \in ]0, 1[$ ),  $\ell_{\gamma_1, \gamma_2}$  is  $\min\{\frac{\gamma_2}{\gamma_1}, 1\}$ -Lipschitz-Hölder from  $B(L_{1/\gamma_1}(\mathcal{N}), \|\cdot\|_{1/\gamma_1})$  to  $B(L_{1/\gamma_2}(\mathcal{N}), \|\cdot\|_{1/\gamma_2})$ , hence, by [3, Lemm. 3.1], also from  $S(L_{1/\gamma_1}(\mathcal{N}), \|\cdot\|_{1/\gamma_1})$  to  $S(L_{1/\gamma_2}(\mathcal{N}), \|\cdot\|_{1/\gamma_2})$ . The nonassociative Mazur map with  $\gamma_1 = 1$  and  $\gamma_2 \in ]1, \infty[$  has appeared implicitly in [1, p. 68], and was introduced in full generality in [206, Def. 4.5].

- (viii) Due to availability of several different (although equivalent) definitions of noncommutative  $L_{1/\gamma}$  spaces over general W\*-algebras, we should specify the default meaning of this notion (since for general W\*-algebras it is defined using the tools essentially beyond the range of the integration theory on semifinite W\*-algebras). In Equation (166), as well as everywhere else, we use the definition of  $L_{1/\gamma}(\mathcal{N})$  (and thus the functional analytic meaning of the symbol ' $|x|^{\gamma_2/\gamma_1}$ ') as given in [138, p. 196]. The sign of integral, appearing in Equation (159) below and further, is understood in the sense of [138, Eqn. (3.12')].
  - (ix) Proposition 4.5 is a generalisation of [204, Thm. 4.2] from (any) W\*-algebras to (semifinite) JBW-algebras. The last step of the second part of the proof (using Rogers-Hölder inequality for  $xx^{1/\gamma-1}$ ) is exactly the same here as there, however we prove the earlier part (corresponding to [204, Lemm. 4.1]), differently, using directly the properties of the duality map, instead of a multiple use of the Rogers-Hölder inequality. [285, Lemm. 3.2] establishes local uniform continuity of  $\ell_{\gamma}$  on  $\mathcal{N}_{\star}$  (this term means [284, p. 70] uniform continuity on every closed ball in  $\mathcal{N}_{\star}$ ). Due to structural analogies between noncommutative and nonassociative integration theories, and in accordance with a tradition of [169, Conj. V.3.10], we conjecture that  $\ell_{\gamma}$  is norm-to-norm continuous also on unit balls of preduals of JBW-algebras. If this would be true, then the continuity results of Proposition 4.7.(v)-(vi) hold for  $A_{\star}$  replacing  $A_{\star}^+$ .

## 4.2 Other models with $\Psi = \Psi_{\varphi}$

**Proposition 4.10.** If  $(X, \|\cdot\|_X)$  is a uniformly convex and uniformly Fréchet differentiable Banach function space over a localisable measure space  $(\mathcal{X}, \mu)$ ,  $\ell_X^{-1} : S(X, \|\cdot\|_X) \ni x \mapsto |j(x)|x \in S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ ,  $\varphi$  is a gauge,  $\Psi_{\varphi} : (X, \|\cdot\|_X) \to \mathbb{R}$ , and  $\varnothing \neq C \subseteq S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ , then:

(i)  $\ell_X$  is a bijection, and  $\ell_X|_{(S(L_1(\mathcal{X},\mu),\|\cdot\|_1))^+} = \overrightarrow{\mathfrak{P}}^{D_1}_{(S(X,\|\cdot\|_X))^+}$ , with  $D_1$  understood as a map  $(L_\infty(\mathcal{X},\mu))^+ \times X \to [0,\infty]$ ;

- $(ii) \ D_{\ell_X,\Psi_{\varphi}}: S(L_1(\mathcal{X},\mu),\|\cdot\|_1) \times S(L_1(\mathcal{X},\mu),\|\cdot\|_1) \rightarrow [0,\infty] \ is \ an \ information \ on \ S(L_1(\mathcal{X},\mu),\|\cdot\|_1);$
- (iii) if C is  $\ell_X$ -convex closed set, then  $D_{\ell_X,\Psi_{\varphi}}$  is zone consistent, left pythagorean on C,  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell_X,\overline{\Psi_{\varphi}}}}$  is norm-to-norm continuous on  $S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$  and adapted, and  $\inf_{y \in C} \{D_{\ell_X, \Psi_{\wp}}(y, \cdot)\}$  is continuous on  $S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ ;
- (iv) if C is  $(j_{\varphi} \circ \ell_X)$ -convex closed set, then  $D_{\ell_X,\Psi_{\varphi}}$  is zone consistent, right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{X},\Psi_{\varphi}}}$  are norm-to-norm continuous in  $S(L_{1}(\mathcal{X},\mu),\|\cdot\|_{1})$  and adapted;
- (v) the sets  $LSQ(\ell_X, \Psi_{\varphi}, C)$  and  $RSQ(\ell_X, \Psi_{\varphi}, C)$  are composable;
- (vi) the categories  $\mathtt{1Cvx}^\subseteq(\ell_X, \Psi_\varphi)$ ,  $\mathtt{rCvx}^\subseteq(\ell_X, \Psi_\varphi)$ ,  $\mathtt{LSQ}^\subseteq_{\mathtt{cvx}}(\ell_X, \Psi_\varphi)$ , and  $\mathtt{\bar{R}SQ}^\subseteq_{\mathtt{cvx}}(\ell_X, \Psi_\varphi)$  satisfy the functorial adjunctions and equivalences given by Corollary 3.46.(i)–(ii) with  $Z = S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ ;
- (vii) if  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex with  $\beta \in ]0, \frac{1}{2}]$ , and C is  $\ell_X$ -convex and closed, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell_X, \Psi_{\varphi_{1,\beta}}}}$ is uniformly continuous on  $\ell_X$ -bounded subsets of  $S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ ;
- (viii) if  $(X, \|\cdot\|_X)$  is  $\frac{1}{1-\beta}$ -uniformly Fréchet differentiable with  $\beta \in ]0, \frac{1}{2}]$ , and C is  $(j_{\varphi_{1,1-\beta}} \circ \ell_X)$ -convex and closed, then  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{X},\Psi_{\varphi_{1,1-\beta}}}}$  is uniformly continuous on  $\ell_{X}$ -bounded subsets of  $S(L_{1}(\mathcal{X},\mu),\|\cdot\|_{1})$ ; (ix) if  $(X,\|\cdot\|_{X})$  is  $\frac{1}{\beta}$ -uniformly convex and  $\frac{1}{\gamma}$ -uniformly Fréchet differentiable, with  $\beta\in ]0,\frac{1}{2}]$  and
  - $\gamma \in [\frac{1}{2}, 1[$ , and C is closed, then:
    - 1) if C is  $\ell_X$ -convex, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell_X,\Psi_{\varphi_{1,\beta}}}}$  is  $\frac{\beta^2}{\gamma^2}\frac{(1-\gamma)^2}{1-\beta}$ -Lipschitz-Hölder continuous on  $S(L_1(\mathcal{X},\mu),\|\cdot\|_1)$ ; 2) if C is  $(j_{\varphi_{1,\gamma}} \circ \ell_X)$ -convex, then  $\overrightarrow{\mathfrak{P}}_C^{D_{\ell_X,\Psi_{\varphi_{1,\beta}}}}$  is  $\frac{\beta^3}{\gamma^3}\frac{(1-\gamma)^3}{(1-\beta)^2}$ -Lipschitz-Hölder continuous on
    - $\ell_X$ -bounded subsets of  $S(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ ;
  - (x) the properties (ii)-(ix) hold also for  $\ell_X$  (and, resp.,  $S(L_1(\mathcal{X},\mu),\|\cdot\|_1)$ ) replaced by  $\widetilde{\ell_X}(x):=$  $\|x\|_1 \ell_X \left(\frac{x}{\|x\|_1}\right) \text{ for } x \in B(L_1(\mathcal{X}, \mu), \|\cdot\|_1) \setminus \{0\} \text{ and } \widetilde{\ell_X}(0) := 0 \text{ (and, resp., } B(L_1(\mathcal{X}, \mu), \|\cdot\|_1)).$

*Proof.* (i) comes straight from the definition of  $\ell_X$  [266, p. 261] [94, pp. 16–17, p. 20] (see [95, §5] for an explicit discussion). By [266, Prop. 2.6] [94, Prop. 2.9] (cf. also [283, Thm. 12]),  $\ell_X^{-1}$  is a uniform homeomorphism. Hence, by [266, Prop. 2.9],  $\ell_X$  is a uniform homeomorphism on  $B(L_1(\mathcal{X}, \mu), \|\cdot\|_1)$ .  $\frac{1-\gamma}{\gamma}$ -(resp.,  $\beta$ -)Lipschitz-Hölder continuity of  $\ell_X$  (resp.,  $\ell_X^{-1}$ ) for  $\frac{1}{\beta}$ -uniformly convex and  $\frac{1}{\gamma}$ -uniformly Fréchet differentiable  $(X, \|\cdot\|_X)$  has been established in [3, Thm. 4.2] (=[5, Thm. 5.6]) (cf. [2, Rem. 3.1.b)] for equivalence of  $\frac{1}{\beta}$ -uniform convexity (resp.,  $\frac{1}{\gamma}$ -uniform Fréchet differentiability) with  $(\frac{1}{\beta}, h_c)$ uniform convexity (resp.,  $(\frac{1}{\gamma}, h_s)$ -uniform Fréchet differentiability) used in [3, Thm. 4.2]). The rest follows from Corollary 3.38 and Proposition 3.29. The part of (x) that refers to (ii)-(viii) relies on equivalence of uniform continuity of  $\ell$  on  $S(Y, \|\cdot\|_{Y})$  with uniform continuity of  $\ell$  on  $B(Y, \|\cdot\|_{Y})$  for any Banach space  $(Y, \|\cdot\|_Y)$ , as provided by (11) and (12), while the part of (x) that refers to (ix) relies on the analogous equivalence for Lipschitz-Hölder continuity, proved in [3, Lemm. 3.1].

**Proposition 4.11.** If  $(X, \|\cdot\|_X)$  is a uniformly convex and uniformly Fréchet differentiable noncommutative rearrangement invariant space over a type  $I_n$   $W^*$ -algebra  $\mathcal{N}$ ,  $\ell_X^{-1}:(S(X,\|\cdot\|_X))^+\ni x\mapsto$  $|j(x)|x \in (S(\mathcal{N}_{\star}, \|\cdot\|_1))^+, \ \varphi \ is \ a \ gauge, \ \Psi_{\varphi}: (X, \|\cdot\|_X) \to \mathbb{R}, \ and \ \varnothing \neq C \subseteq (S(\mathcal{N}_{\star}, \|\cdot\|_1))^+, \ then:$ 

- (i)  $\ell_X$  is a bijection, and  $\ell_X = \overline{\mathfrak{P}}^{D_1}_{(S(X,\|\cdot\|_X))^+};$ (ii)  $D_{\ell_X,\Psi_{\varphi}}: ((S(\mathcal{N}_{\star},\|\cdot\|_1))^+ \times (S(\mathcal{N}_{\star},\|\cdot\|_1))^+ \to [0,\infty]$  is an information on  $(S(\mathcal{N}_{\star},\|\cdot\|_1))^+;$
- (iii) if C is  $\ell_X$ -convex closed set, then  $D_{\ell_X,\Psi_{\varphi}}$  is zone consistent, left pythagorean on C,  $\mathfrak{F}_C^{D_{\ell_X},\Psi_{\varphi}}$  is norm-to-norm continuous on  $(S(\mathcal{N}_{\star},\|\cdot\|_1))^+$  and adapted, and  $\inf_{y\in C}\{D_{\ell_X,\Psi_{\varphi}}(y,\cdot)\}$  is continuous on  $(S(\mathcal{N}_{\star}, \|\cdot\|_1))^+$ ;
- (iv) if C is  $(j_{\varphi} \circ \ell_X)$ -convex closed set, then  $D_{\ell_X,\Psi_{\varphi}}$  is zone consistent, right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{X},\Psi_{\varphi}}}$  are norm-to-norm continuous in  $(S(\mathcal{N}_{\star},\|\cdot\|_{1}))^{+}$  and adapted;
- (v) the sets  $LSQ(\ell_X, \Psi_{\varphi}, C)$  and  $RSQ(\ell_X, \Psi_{\varphi}, C)$  are composable;
- (vi) the categories  $1\text{Cvx} \subseteq (\ell_X, \Psi_\varphi)$ ,  $\overline{\text{rCvx}} \subseteq (\ell_X, \Psi_\varphi)$ ,  $LSQ_{cvx} \subseteq (\ell_X, \Psi_\varphi)$ , and  $\overline{R}SQ_{cvx} \subseteq (\ell_X, \Psi_\varphi)$  satisfy the functorial adjunctions and equivalences given by Corollary 3.46.(i)–(ii) with  $Z = (S(\mathcal{N}_{\star}, \|\cdot\|_1))^+$ ;
- (vii) if  $(X, \|\cdot\|_X)$  is  $\frac{1}{\beta}$ -uniformly convex, and C is  $\ell_X$ -convex and closed, then  $\overleftarrow{\mathfrak{P}}_C^{D_{\ell_X, \Psi_{\varphi_{1,\beta}}}}$  is uniformly continuous on  $\ell_X$ -bounded subsets of  $(S(\mathcal{N}_{\star}, \|\cdot\|_1))^+$ ;

 $(viii) \ \ if \ (X,\|\cdot\|_X) \ \ is \ \ \frac{1}{1-\beta} \ -uniformly \ \ Fr\'echet \ \ differentiable, \ \ and \ \ C \ \ is \ \ (j_{\varphi_{1,1-\beta}} \circ \ell_X) \ -convex \ \ and \ \ closed,$ then  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell_{X},\Psi\varphi_{1,1-\beta}}}$  is uniformly continuous on  $\ell_{X}$ -bounded subsets of  $(S(\mathcal{N}_{\star},\|\cdot\|_{1}))^{+}$ .

*Proof.* (i) is just [95, Def. 5.3]. By [95, Prop. 5.6, Prop. 5.7, Lemm. 5.8]  $\ell_X^{-1}$  is a uniform homeomorphism. The rest follows from Corollary 3.38 and Proposition 3.29.

**Proposition 4.12.** If  $(V, \|\cdot\|_V)$  is a radially compact base normed space with a weakly compact base  $K, \varphi \text{ is any gauge, } \varnothing \neq C \subseteq V, \Psi_{\varphi}: V \to \mathbb{R} \text{ is Euler-Legendre, } \ell: V \to V \text{ is any automorphism of }$ V, then:

- (i)  $D_{\ell,\Psi_{\varphi}}$  is an information on V;
- (ii) if C is  $\ell$ -convex and  $\ell$ -closed, then it is left  $D_{\ell,\Psi_{\varphi}}$ -Chebyshëv,  $D_{\ell,\Psi_{\varphi}}$  is left pythagorean on C,
- and  $\mathfrak{P}_{C}^{D_{\ell,\Psi_{\varphi}}}$  are zone consistent; (iii) if C is  $j_{\varphi} \circ \ell$ -convex and  $j_{\varphi} \circ \ell$ -closed, then it is right  $D_{\ell,\Psi_{\varphi}}$ -Chebyshëv,  $D_{\ell,\Psi_{\varphi}}$  is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi_{\varphi}}}$  are zone consistent;
- (iv) if each norm-exposed face of K is projective, then the pair  $((V, \|\cdot\|_V), (V^*, \|\cdot\|_{V^*}))$  is in spectral duality.

*Proof.* A radially compact base normed space is reflexive iff its base is weakly compact [18, Lemm. 8.71]. Hence, (i)–(iii) follow from Proposition 3.12 and Corollary 3.38.(i)–(iii). On the other hand, (iv) is just [17, Prop. 2.5].

**Proposition 4.13.** Let  $(V = X \oplus \mathbb{R}, \|\cdot\|_V)$  be a radially compact base normed space with a base K, and a reflexive real Banach space  $(X, \|\cdot\|_X)$  such that

$$\forall v = (x, \lambda) \in V \quad \left\{ \begin{array}{l} v \ge 0 : \iff \lambda \ge ||x||_X \\ ||v||_V := \max\{|\lambda|, ||x||_X\}, \end{array} \right. \tag{167}$$

let  $\ell_{/\mathbb{R}}: K \ni v = (x,1) \mapsto x \in B(X,\|\cdot\|_X)$ , and let  $\varphi$  be any gauge. If any of equivalent conditions holds,

- 1) the pair  $((V, \|\cdot\|_V), (V^*, \|\cdot\|_{V^*}))$  is in spectral duality;
- 2)  $(X, \|\cdot\|_X)$  is strictly convex and Gateaux differentiable;
- 3)  $\Psi_{\varphi}: B(X, \|\cdot\|_X) \to \mathbb{R}$  is Euler-Legendre,
- (i)  $D_{\ell_{/\mathbb{R}},\Psi_{\varphi}}$  is an information on K; (ii) if  $\varnothing \neq C \subseteq K$  is  $\ell_{/\mathbb{R}}$ -convex and  $\ell_{/\mathbb{R}}$ -closed, then it is left  $D_{\ell_{/\mathbb{R}},\Psi_{\varphi}}$ -Chebyshëv,  $D_{\ell_{/\mathbb{R}},\Psi_{\varphi}}$  is left  $\begin{array}{c} pythagorean \ on \ C, \ and \ \overleftarrow{\mathfrak{P}}_{C}^{D_{\ell/\mathbb{R}},\Psi_{\varphi}} \ \ are \ zone \ consistent; \\ (iii) \ \ if \ \varnothing \neq C \subseteq K \ \ is \ j_{\varphi} \circ \ell_{/\mathbb{R}}\text{-}convex \ and \ j_{\varphi} \circ \ell_{/\mathbb{R}}\text{-}closed, \ then \ it \ is \ right \ D_{\ell/\mathbb{R},\Psi_{\varphi}}\text{-}Chebysh\"{e}v, \ D_{\ell/\mathbb{R},\Psi_{\varphi}} \ \ \end{array}$
- is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell/\mathbb{R}},\Psi_{\varphi}}$  are zone consistent.

Furthermore, if  $(X, \|\cdot\|_X)$  satisfies any of 1)-3) above, is uniformly Fréchet differentiable, and has the Radon-Riesz-Shmul'yan property, then:

- (iv) LSQ( $\ell_{\mathbb{R}}, \Psi_{\varphi}, C$ ) and RSQ( $\ell_{\mathbb{R}}, \Psi_{\varphi}, C$ ) are composable for any  $\emptyset \neq C \subseteq K$ ;
- $(v) \stackrel{\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell/\mathbb{R}},\Psi_{\varphi}}}{=} are \ adapted \ and \ \ell_{/\mathbb{R}} topology to \ell_{/\mathbb{R}} topology \ continuous \ on \ any \ \ell_{/\mathbb{R}} convex \ and \ \ell_{/\mathbb{R}} topology to \ell_{/\mathbb{R}} topology topology to \ell_{/\mathbb{R}} topology to \ell_{/\mathbb{R}} topology to \ell_{/\mathbb{R}} topology$  $closed \varnothing \neq C \subseteq K;$
- $(vi) \ \overrightarrow{\mathfrak{P}}_{C}^{D_{\ell/\mathbb{R}},\Psi_{\varphi}} \ \ are \ \ell_{/\mathbb{R}} \text{-}topology\text{-}to\text{-}\ell_{/\mathbb{R}} \text{-}topology \ continuous \ on \ any} \ (j_{\varphi} \circ \ell_{/\mathbb{R}})\text{-}convex \ and} \ \ell_{/\mathbb{R}} \text{-}closed \ \ d_{\mathbb{R}} \text{-}closed \ \ d_$  $\emptyset \neq C \subseteq K$ ;
- (vii) the categories  $1\text{Cvx}^{\subseteq}(\ell_{/\mathbb{R}}, \Psi_{\varphi})$ ,  $\overline{r}\text{Cvx}^{\subseteq}(\ell_{/\mathbb{R}}, \Psi_{\varphi})$ ,  $LSQ_{\overline{cvx}}^{\subseteq}(\ell_{/\mathbb{R}}, \Psi_{\varphi})$ , and  $\overline{R}SQ_{\overline{cvx}}^{\subseteq}(\ell_{/\mathbb{R}}, \Psi_{\varphi})$  satisfy the functorial adjunctions and equivalences given by Corollary 3.46.(i) with Z = K;

  (viii) if  $(X, \|\cdot\|_X)$  is uniformly convex, then  $\overrightarrow{\mathfrak{P}}_C^{D_{\ell/\mathbb{R}}, \Psi_{\varphi}}$  are adapted for any  $(j_{\varphi} \circ \ell_{/\mathbb{R}})$ -convex and  $\ell_{/\mathbb{R}}$ -
- closed  $\varnothing \neq C \subseteq K$ , while the categories  $\bar{\mathtt{r}}\mathsf{Cvx}^\subseteq(\ell_{/\mathbb{R}},\Psi_{\varphi})$  and  $\bar{\mathtt{R}}\mathsf{SQ}^\subseteq_{\mathsf{cvx}}(\ell_{/\mathbb{R}},\Psi_{\varphi})$  satisfy the functorial adjunction of Corollary 3.46.(ii).

*Proof.* Equivalence of 1) and 2) was established in [50, Thm. 1] (and recently rediscovered in [181, Thm. 6.6]). Equivalence of 2) and 3) follows from Proposition 3.12. Consequences (i)−(iii) follow from Corollary 3.38.(i)−(iii). Consequences (iv)−(viii) follow from Corollaries 3.38.(iv), 3.38.(vi)−(viii), and 3.46.

- Remark 4.14. (i) Using [266, Thm. 2.1] [94, Thm. 2.1] [4, Thm. 6.2] (resp., [95, Thm. 6.4]), combined together with the Maurey-Pisier theorem [245, p. 46] and a fact that q-uniform convexity with  $q \geq 2$  implies cotype q [226, Thm. 1.e.16.(i) (Vol. 2)], one can state an analogue of Proposition 4.10.(ii)-(x) (resp., Proposition 4.11.(ii)-(viii)) for q-uniformly convex  $(X, \|\cdot\|_X)$  with  $q \geq 2$ . (In the case of Proposition 4.11.(ii)-(viii), the resulting proposition includes also a generalisation of  $\mathcal N$  from type  $I_n$  to separable factors of type I.) However, in both cases, the corresponding uniform homeomorphism  $\ell$ , as well as  $\ell^{-1}$ , is constructed via renorming of the convexification of  $(X, \|\cdot\|_X)$ , and as a result it lacks an explicit formula.
  - (ii) Let  $(\mathcal{X}, \mu)$  be a localisable measure space, and let  $E(\mathcal{X}, \mu) \subseteq L_0(\mathcal{X}, \mu)$  be a complete Banach vector lattice. Let  $E(\mathcal{X}, \mu)$  satisfy also the Fatou property, i.e. if  $\{x_n \in (E(\mathcal{X}, \mu))^+ : n \in \mathbb{N}\}$  is increasing and  $\sup_{n \in \mathbb{N}} \|x_n\|_{E(\mathcal{X}, \mu)} < \infty$ , then there exists  $\sup_{n \in \mathbb{N}} x_n = x \in E(\mathcal{X}, \mu)$  and  $\sup_{n \in \mathbb{N}} \|x_n\|_{E(\mathcal{X}, \mu)} = \|x_n\|_{E(\mathcal{X}, \mu)} \|267$ ,  $(\beta)_3$  (p. 45)] [236, (1)–(2) (p. 1)]. (In particular, if  $E(\mathcal{X}, \mu)$  is reflexive, then it satisfies the Fatou property [267, Thm. §3.1].) Lozanovskiĭ proved [233, Thm. 6.3] that  $\forall x \in L_1(\mathcal{X}, \mu) \exists (y, z) \in E(\mathcal{X}, \mu) \times (E(\mathcal{X}, \mu))^\times$  such that x = yz and  $\|x\|_1 = \|y\|_{E(\mathcal{X}, \mu)} \|z\|_{(E(\mathcal{X}, \mu))^\times}$ . The uniqueness of this factorisation, under additional assumption  $\sup_{x \in \mathbb{N}} (x_x) \|z\|_{E(\mathcal{X}, \mu)} \|z\|_{E(\mathcal$
- (iii) Proposition 4.10 (when restricted to the positive parts of unit spheres) and Proposition 4.11 deal with the special cases of left and right  $D_{\ell,\Psi}$ -projections with  $\ell$  given by another special case of right  $D_{\ell,\Psi}$ -projection, i.e.  $\overleftarrow{\mathfrak{P}}_C^{D_{\overrightarrow{\mathfrak{P}}_{(S(X,\|\cdot\|_X))^+},\Psi_{\varphi}}}$  and  $\overrightarrow{\mathfrak{P}}_C^{D_{\overrightarrow{\mathfrak{P}}_{(S(X,\|\cdot\|_X))^+},\Psi_{\varphi}}}$ . This leads to a question: is it possible to use the latter projection as  $\ell$  in some appropriate context?
- (iv) In both Proposition 4.10 and Proposition 4.11, one can replace j with  $j_{\widetilde{\varphi}}$  for any gauge  $\widetilde{\varphi}$  satisfying  $\widetilde{\varphi}(1) = 1$ , since [283, Thm. 12] and [95, Prop. 5.6, Prop. 5.7, Lemm. 5.8] are proved by evaluation of j exclusively on the unit spheres (or their positive parts).
- (v) Examples of radially compact base normed spaces with weakly compact base include all finite dimensional base normed spaces, type I<sub>2</sub> JBW-factors [18, Prop. 3.38] (their reflexivity was established already in [231, Ex. 2]), and state spaces of orthomodular posets satisfying the Jordan–Hahn decomposition property [141, Thm. 3].
- (vi) Order unit spaces  $(V^*, \|\cdot\|_{V^*})$  satisfying the condition 2) in Proposition 4.13 were introduced in [50, Def. 4], and named the **generalised spin factors** (cf. also [212, §2.3.3], where their finite dimensional version was rediscovered as 'centrally symmetric models'). For X given by a real Hilbert space with a scalar product  $\langle\cdot,\cdot\rangle_X$ ,  $(X^*\oplus\mathbb{R},\|\cdot\|_{X^*\oplus\mathbb{R}})$  turn into spin factors.
- (vii) Relationship between the properties of  $\Psi_{\varphi}$  and the spectral properties of  $(V, \|\cdot\|_{V})$  differ strongly between Propositions 4.12 and 4.13: in the first case there is no relationship between them, in the second case it is a characterisation.
- (viii) Proposition 4.13.(i)–(iii) holds also under replacing a gauge  $\varphi$  by a quasigauge  $\varphi$ , provided the latter satisfies the respective conditions of Proposition 3.22.

### Some models with $\Psi \neq \Psi_{\omega}$

**Proposition 4.15.** Let  $\mathcal{H}$  (resp.,  $\ell_{1/2}$ ) be either an  $(L_2(\mathcal{N}))^{\mathrm{sa}}$  space for any  $W^*$ -algebra  $\mathcal{N}$  (resp., a  $map \ \mathcal{N}_{\star}^{sa} \ni \phi = u_{\phi}|\phi| \mapsto u_{\phi}|\phi|^{1/2} \in (L_2(\mathcal{N}))^{sa}) \ or \ an \ L_2(A,\tau) \ space \ for \ a \ semifinite \ JBW-algebra \ A$ with a faithful normal semifinite trace  $\tau$  (resp., a map  $A_{\star} \cong L_1(A, \tau) \ni s_{\phi} \bullet |\phi| \mapsto s_{\phi} \bullet |\phi|^{1/2} \in L_2(A, \tau)$ ), let  $\mathcal{B}$  be a ball in  $\mathcal{N}_{\star}$  (e.g.,  $\mathcal{B} = B(\mathcal{N}_{\star}, \|\cdot\|_1)$ ), and let  $T : \mathcal{H} \to \mathcal{H}$  be a continuous linear map such that  $\exists \lambda > 0 \ \forall x, y \in \mathcal{H} \ \langle Ty - Tx, y - x \rangle_{\mathcal{H}} \geq \lambda \|x - y\|_{\mathcal{H}}^2 \ (or, equivalently, \inf\{\langle T\xi, \xi \rangle_{\mathcal{H}} : \xi \in \mathcal{H}, \|\xi\|_{\mathcal{H}} = 1$  $1\} \ge 1$ ). Then:

- (i) T is invertible;
- (ii)  $\Psi_T: \mathcal{H} \to \mathbb{R}$  given by  $\Psi_T(x) := \frac{1}{2} \langle Tx, x \rangle_{\mathcal{H}}$  is Euler–Legendre; (iii)  $\Psi_T^{\mathbf{F}} = \frac{1}{2} \langle T^{-|}y, y \rangle_{\mathcal{H}} \ \forall y \in \mathcal{H}, \ \mathfrak{D}^{\mathbf{G}}\Psi_T = T, \ \mathfrak{D}^{\mathbf{G}}\Psi_T^{\mathbf{F}} = T^{-|};$

- (iv)  $D_{\Psi_T}(x,y) = \frac{1}{2} \langle Tx Ty, x y \rangle_{\mathcal{H}};$ (v)  $D_{\ell_{1/2},\Psi_T}$  is an information on  $\mathcal{N}_{\star}^{\text{sa}}$  (resp.,  $A_{\star}$ );
- (vi) if  $\varnothing \neq C \subseteq \mathcal{N}_{\star}^+ \cup \mathcal{B}$  (resp.,  $\varnothing \neq C \subseteq A_{\star}^+$ ) is  $\ell_{1/2}$ -convex and closed, then it is left  $D_{\ell_{1/2},\Psi_T}$ -Chebyshëv,  $D_{\ell_{1/2},\Psi_T}$  is left pythagorean on C, and  $\mathfrak{F}_C^{D_{\ell_{1/2},\Psi_T}}$  are zone consistent; (vii) if  $\varnothing \neq C \subseteq \mathcal{N}_{\star}^+ \cup \mathcal{B}$  (resp.,  $\varnothing \neq C \subseteq A_{\star}^+$ ) is  $T \circ \ell_{1/2}$ -convex and T-closed, then it is right
- $D_{\ell_{1/2},\Psi_T}\text{-}Chebysh\"{e}v,\ D_{\ell_{1/2},\Psi_T}\ is\ right\ pythagorean\ on\ C,\ and\ \overrightarrow{\mathfrak{P}}_C^{D_{\ell_{1/2},\Psi_T}}\ are\ zone\ consistent.$

*Proof.* (i)–(iv) are special cases of results which hold for any real Hilbert space  $\mathcal{H}$ . (i) follows from [215, Thm. 2.1]; (ii) follows from [287, p. 64]; (iii) follows from [286, Ex. 3.2]; (iv) follows by a direct calculation; (v) follows from conjunction of (ii), Corollary 2.9, and 3.37.(i); (vi) follows from Corollary 3.37.(iii) and norm-to-norm continuity of  $\ell_{1/2}$  on  $\mathcal{N}_{\star}^+ \cup \mathcal{B}$  (resp.,  $A_{\star}^+$ ) [204, Thm. 4.2] [285, Lemm. 3.2] (resp., Proposition 4.5); (vii) follows from Corollary 3.37.(iv) and norm-to-norm continuity of  $\ell_{1/2}$ .

**Proposition 4.16.** Let  $\mathcal{H}$  be a Hilbert space with  $\dim \mathcal{H} < \infty$ , let  $\dim((\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}}) =: n$ , and let  $\Psi \in \Gamma^{G}((\mathfrak{G}_{2}(\mathcal{H}))^{\operatorname{sa}}, \|\cdot\|_{2})$  be spectral, with  $\Psi = f \circ \lambda$ , where  $f \in \Gamma^{G}(\mathbb{R}^{n}, \|\cdot\|_{\mathbb{R}^{n}})$  is Euler-Legendre. Let  $\ell$  (resp.,  $C \neq \varnothing$ ;  $K \neq \varnothing$ ) be given either by a bijection  $\ell : Y := (\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}} \to (\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}}$  (resp., a closed  $\ell$ -convex subset of  $(\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}}$ ; a closed  $(\mathrm{grad}\Psi) \circ \ell$ -convex subset of  $(\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}}$ ) or by a bijection  $\ell_{1/2}: Y := (\mathfrak{G}_1(\mathcal{H}))^{\mathrm{sa}} \ni x \mapsto x^{1/2} \in (\mathfrak{G}_2(\mathcal{H}))^{\mathrm{sa}} \ (resp., \ a \ closed \ \ell_{1/2}\text{-}convex \ subset \ of \ (\mathfrak{G}_1(\mathcal{H}))^{\mathrm{sa}}; \ a$ closed  $(\operatorname{grad}\Psi) \circ \ell_{1/2}$ -convex subset of  $(\mathfrak{G}_1(\mathcal{H}))^{\operatorname{sa}}$ ). Let  $\ell(C) \subseteq \operatorname{int}(\operatorname{efd}(\Psi)) \supseteq \ell(K)$ . Then:

- (i)  $D_{\ell,\Psi}$  is an information on Y;
- (ii) C is left  $D_{\ell,\Psi}$ -Chebyshëv,  $D_{\ell,\Psi}$  is left pythagorean on C, and  $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,\Psi}}$  are zone consistent; (iii) K is right  $D_{\ell,\Psi}$ -Chebyshëv,  $D_{\ell,\Psi}$  is right pythagorean on K, and  $\overrightarrow{\mathfrak{P}}_{K}^{D_{\ell,\Psi}}$  are zone consistent.

*Proof.* Follows from the fact that f is Euler-Legendre iff  $f \circ \lambda$  is Euler-Legendre (see Example 2.3), combined with Propositions 2.8.(i).c), 2.8.(iii), 3.1.c), and Corollary 2.9.

Corollary 4.17. Proposition 4.16 holds, in particular, for  $\Psi = f \circ \lambda$  and  $D_{\Psi} = D_{f \circ \lambda}$  given in Example 2.3.(i)-(iii), as well as for:

(iv)  $f(x) = \sum_{i=1}^{n} (x_i \log(x_i) + (1-x_i) \log(1-x_i))$  on  $\operatorname{efd}(f) = [0,1]^n$  and  $\infty$  otherwise, which gives spectral Euler-Legendre  $(f \circ \lambda)(\xi) = \operatorname{tr}_{\mathcal{H}}(\xi \log(\xi) + (\mathbb{I} - \xi) \log(\mathbb{I} - \xi))$  for  $\xi \in \operatorname{efd}(f \circ \lambda) = (-\xi)(\xi - \xi)$  $B(\mathfrak{G}_2(\mathcal{H}), \|\cdot\|_2) \cap (\mathfrak{G}_2(\mathcal{H}))^+$  and  $\infty$  otherwise. The corresponding Vainberg-Brègman functional reads

$$D_{f \circ \lambda}(\xi, \zeta) = \operatorname{tr}_{\mathcal{H}}(\xi(\log \xi - \log \zeta) + (\mathbb{I} - \xi)(\log(\mathbb{I} - \xi) - \log(\mathbb{I} - \zeta)))$$
(168)

for  $(\xi, \zeta) \in \operatorname{efd}(f \circ \lambda) \times \operatorname{int}(\operatorname{efd}(f \circ \lambda))$ , and  $\infty$  otherwise;

(v) f given by  $\Psi_{\alpha}$  in (47), which gives spectral Euler-Legendre

$$(f \circ \boldsymbol{\lambda})(\xi) = \begin{cases} \frac{1}{\alpha - 1} \operatorname{tr}_{\mathcal{H}}(\xi^{\alpha} - 1) & : \xi \in (\mathfrak{G}_{2}(\mathcal{H}))^{+}, \ \alpha \in ]0, 1[\\ \frac{1}{1 - \alpha} \operatorname{tr}_{\mathcal{H}}(\xi^{\alpha} - 1) & : \xi \in (\mathfrak{G}_{2}(\mathcal{H}))^{+}_{0}, \ \alpha \in ]-\infty, 0[\\ \infty & : otherwise. \end{cases}$$
(169)

The corresponding Vaĭnberg-Brègman functional  $D_{f \circ \lambda}(\xi, \zeta)$  reads

$$\begin{cases}
\frac{1}{1-\alpha}\operatorname{tr}_{\mathcal{H}}(-\xi^{\alpha}+(1-\alpha)\zeta^{\alpha}+\alpha\zeta^{\alpha-1}\xi) & : (\xi,\zeta)\in(\mathfrak{G}_{2}(\mathcal{H}))^{+}\times(\mathfrak{G}_{2}(\mathcal{H}))_{0}^{+}, \ \alpha\in]0,1[\\
\frac{1}{\alpha-1}\operatorname{tr}_{\mathcal{H}}(-\xi^{\alpha}+(1-\alpha)\zeta^{\alpha}+\alpha\zeta^{\alpha-1}\xi) & : (\xi,\zeta)\in(\mathfrak{G}_{2}(\mathcal{H}))_{0}^{+}\times(\mathfrak{G}_{2}(\mathcal{H}))_{0}^{+}, \ \alpha\in]-\infty,0[\\
\infty & : otherwise.
\end{cases}$$
(170)

*Proof.* (iv)–(v) follow by application of  $\lambda$  to Examples 2.2.(iv)–(v).

Corollary 4.18. Let  $\mathcal{N}$  be a type  $I_n$   $W^*$ -algebra,  $f(x) = \sum_{i=1}^n (x_i \log(x_i) - x_i)$  if  $x \geq 0$  and  $\infty$  otherwise for any  $x \in \mathbb{R}^n$ . Then  $\operatorname{CPTP}(\mathcal{N}_{\star}) \subseteq \operatorname{CN}(\ell_{1/2}, f \circ \lambda)$ .

*Proof.* Follows from Corollary 4.17.(ii), combined with [224, Thm. (p. 149)].

**Proposition 4.19.** Let  $(l, \|\cdot\|_l)$  be a reflexive separable rearrangement invariant sequence space, and let  $(\mathfrak{G}(\mathcal{H}), \|\cdot\|_{\mathfrak{G}(\mathcal{H})})$  be a rearrangement invariant space of compact operators on a separable Hilbert space  $\mathcal{H}$ , corresponding to  $(l, \|\cdot\|_l)$  via  $\mathfrak{G}(\mathcal{H}) = \{x \in \mathfrak{C}(\mathcal{H}) : x^{\tau} \in l\}$  and  $\|\cdot\|_{\mathfrak{G}(\mathcal{H})} = \|(\cdot)^{\tau}\|_l$ , where  $x^{\tau}$  denotes a decreasing rearrangement of eigenvalues of x, while  $\mathfrak{C}(\mathcal{H})$  denotes the space of compact operators on  $\mathcal{H}$ . For any  $x \in l$  consider sets  $I_{>}(x) := \{i \in \mathbb{N} : x_i > 0\}$ ,  $I_{=}(x) := \{i \in \mathbb{N} : x_i = 0\}$ ,  $I_{<}(x) := \{i \in \mathbb{N} : x_i < 0\}$ . Let  $\widehat{\lambda} : l \to l$  be defined by the following procedure:

- (0) let j := 1;
- (1) if  $I_{>}(x) \neq \emptyset$ , then:
  - (i) choose  $i \in I_{>}(x)$  maximising  $x_i$ ;
  - (ii)  $(\widehat{\lambda})_j := x_i;$

(iii) redefine 
$$\left\{ \begin{array}{l} I_{>}(x) := I_{>}(x) \setminus \{i\} \\ j := j+1; \end{array} \right.$$

- (2) if  $I_{=}(x) \neq \emptyset$ , then:
  - (i) choose  $i \in I_{=}(x)$ ;
  - (ii)  $(\widehat{\lambda})_j := 0$ ;

(iii) redefine 
$$\begin{cases} I_{=}(x) := I_{=}(x) \setminus \{i\} \\ j := j+1; \end{cases}$$

- (3) if  $I_{\leq}(x) \neq \emptyset$ , then:
  - (i) choose  $i \in I_{<}(x)$  minimising  $x_i$ ;
  - $(ii) (\lambda)_i := x_i,$

(iii) redefine 
$$\begin{cases} I_{<}(x) := I_{<}(x) \setminus \{i\} \\ j := j+1; \end{cases}$$

(4) go to (1).

Let  $\widetilde{\boldsymbol{\lambda}}: (\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}} \to l$  be defined by  $\widetilde{\boldsymbol{\lambda}}(y) := \widehat{\boldsymbol{\lambda}}(\widetilde{y})$ , where  $\widetilde{y}$  is any sequence of eigenvalues of  $y \in (\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}}$ , counted with multiplicities. Let  $f \in \Gamma^{\operatorname{G}}(l, \|\cdot\|_{l})$ , with  $\operatorname{int}(\operatorname{efd}(f^{\mathbf{F}})) \neq \varnothing$ ,  $\operatorname{int}(\operatorname{efd}(f \circ \widetilde{\boldsymbol{\lambda}})) \neq \varnothing$ , and  $(f \circ \widetilde{\boldsymbol{\lambda}})(uxu^{*}) = (f \circ \widetilde{\boldsymbol{\lambda}})(x) \ \forall x \in (\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}} \ \forall \ unitary \ u \in \mathfrak{B}(\mathcal{H})$ . Then  $f \circ \widetilde{\boldsymbol{\lambda}}$  is Euler-Legendre iff f is Euler-Legendre, with  $(f \circ \widetilde{\boldsymbol{\lambda}})^{\mathbf{F}} = f^{\mathbf{F}} \circ \widetilde{\boldsymbol{\lambda}}$ .

Proof. Follows directly from [57, Thm. 3.3, Thm. 5.9], combined with the characterisation of Euler–Legendre functions on reflexive Banach spaces given in [290, §2.1]. Reflexivity of  $((\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}}, \|\cdot\|_{(\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}}})$  follows from [128, Prop. 6.8.15] (cf. also [23, p. 153]). The equivalence of single-valuedness of  $\partial f$  on  $\operatorname{efd}(\partial f)$  with single-valuedness of  $\partial (f \circ \lambda)$  on  $\operatorname{efd}(f \circ \lambda)$ , as well as the corresponding property of their Mandelbrojt–Fenchel duals, is a direct consequence of the proof of [57, Thm. 5.9], when used without the restriction to the points of Gateaux differentiability. While [57, Thm. 5.9] is stated only for  $((\mathfrak{G}_{1/\gamma}(\mathcal{H}))^{\operatorname{sa}}, \|\cdot\|_{(\mathfrak{G}_{1/\gamma}(\mathcal{H}))^{\operatorname{sa}}})$ ,  $\gamma \in ]0,1[$ , it holds also in the more general case considered here, since the only property of  $((\mathfrak{G}_{1/\gamma}(\mathcal{H}))^{\operatorname{sa}}, \|\cdot\|_{(\mathfrak{G}_{1/\gamma}(\mathcal{H}))^{\operatorname{sa}}})$  it relies upon (apart from reflexivity), is [57, Prop. 5.3]. However, by [307, Thm. 3.5], the latter holds in every rearrangement invariant  $((\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}}, \|\cdot\|_{(\mathfrak{G}(\mathcal{H}))^{\operatorname{sa}}})$ .

**Proposition 4.20.** Let  $(l, \|\cdot\|_l)$  be a reflexive separable rearrangement invariant sequence space, and let  $(\mathfrak{G}(\mathcal{H}), \|\cdot\|_{\mathfrak{G}(\mathcal{H})})$  be a rearrangement invariant space of compact operators on a separable Hilbert space

 $\mathcal{H}$ , corresponding to  $(l, \|\cdot\|_l)$  as in Proposition 4.19. Let  $\widetilde{\lambda}$  be defined as in Proposition 4.19. Let  $f \in$  $\Gamma^{\mathrm{G}}(l, \|\cdot\|_{l})$  be Euler-Legendre,  $\mathrm{int}(\mathrm{efd}(f \circ \widetilde{\boldsymbol{\lambda}})) \neq \varnothing$ ,  $\mathrm{int}(\mathrm{efd}(f^{\mathrm{F}} \circ \widetilde{\boldsymbol{\lambda}})) \neq \varnothing$ , and  $(f \circ \widetilde{\boldsymbol{\lambda}})(uxu^{*}) = (f \circ \widetilde{\boldsymbol{\lambda}})(x)$  $\forall x \in (\mathfrak{G}(\mathcal{H}))^{\mathrm{sa}} \ \forall \ unitary \ u \in \mathfrak{B}(\mathcal{H}).$  If one of the following conditions holds:

- $a) \ \ell = \ell_{1/\gamma}|_{(\mathfrak{G}_1(\mathcal{H}))^{\mathrm{sa}}}, \ (\mathfrak{G}(\mathcal{H}), \|\cdot\|_{\mathfrak{G}(\mathcal{H})}) = (\mathfrak{G}_{1/\gamma}(\mathcal{H}), \|\cdot\|_{1/\gamma}), \ \varnothing \neq C \subseteq (\mathfrak{G}_1(\mathcal{H}))^+ \cup B((\mathfrak{G}_1(\mathcal{H}))^{\mathrm{sa}}, \|\cdot\|_1),$  $Z = (\mathfrak{G}_1(\mathcal{H}))^{sa};$
- b)  $\ell=\ell_X$ , with a finite dimensional uniformly convex and uniformly Fréchet differentiable rearrangement invariant space  $(X, \|\cdot\|_X) = (\mathfrak{G}(\mathcal{H}), \|\cdot\|_{\mathfrak{G}(\mathcal{H})}), \varnothing \neq C \subseteq (B(\mathfrak{G}_1(\mathcal{H}), \|\cdot\|_1))^+, Z =$  $(B(\mathfrak{G}_1(\mathcal{H}), \|\cdot\|_1))^+,$

then:

- $\begin{array}{l} \hbox{\it (i)} \ \ D_{\ell,f\circ\widetilde{\pmb{\lambda}}} \ \ is \ an \ information \ on \ Z; \\ \hbox{\it (ii)} \ \ if \ C \ is \ \ell\text{-convex and closed, then } C \ \ is \ left \ D_{\ell,f\circ\widetilde{\pmb{\lambda}}}\text{-}Chebysh\"{e}v, \ D_{\ell,f\circ\widetilde{\pmb{\lambda}}} \ \ is \ left \ pythagorean \ on \ C, \ and \end{array}$
- $\overleftarrow{\mathfrak{P}}_{C}^{D_{\ell,f}\circ\widetilde{\boldsymbol{\lambda}}} \ \ are \ zone \ consistent;$   $(iii) \ \ if \ C \ \ is \ (\mathfrak{D}^{\mathrm{G}}(f\circ\widetilde{\boldsymbol{\lambda}}))\circ\ell\text{-}convex \ \ and \ (\mathfrak{D}^{\mathrm{G}}(f\circ\widetilde{\boldsymbol{\lambda}}))\text{-}closed, \ then } C \ \ is \ right \ D_{\ell,f\circ\widetilde{\boldsymbol{\lambda}}}\text{-}Chebysh\"{e}v, \ D_{\ell,f\circ\widetilde{\boldsymbol{\lambda}}}$ is right pythagorean on C, and  $\overrightarrow{\mathfrak{P}}_{C}^{D_{\ell,f\circ\widetilde{\lambda}}}$  are zone consistent.

*Proof.* Follows from Proposition 4.19, combined with Propositions 2.8.(i).c), 2.8.(iii), 3.1.c), and Corollary 2.9. Homeomorphy of  $\ell_{\gamma}$  follows from combination of [204, Thm. 4.2] and [285, Lemm. 3.2], while homeomorphy of  $\ell_X$  follows from [95, Prop. 5.6, Prop. 5.7, Lemm. 5.8].

- (i) The condition on  $T: \mathcal{H} \to \mathcal{H}$  assumed in Proposition 4.15 holds, in particular, when T is positive semidefinite and invertible [286, Ex. 3.2], as well as when  $\mathcal{H}$  is finite dimensional and T is symmetric and positive definite [287, p. 64] (this case goes back to [66, p. 15]). For  $T = \mathbb{I}_{\mathcal{H}}$  with arbitrary dimensional  $\mathcal{H}$ , one obtains  $D_{\Psi_T} = D_{\varphi_{1,1/2}}$  (see Remark 3.33.(ix)), which was considered as an example (for dim  $\mathcal{H} < \infty$ ) already in [65, p. 1021] and [66, §2.1].
- (ii) The formula (168) has appeared earlier in [265, p. 376], however without using spectral convex functions (the Taylor expansion formula, and the finite dimensional quantum analogue  $D_{\Pi}^{\text{tr}\mathcal{H}}$  of the Brunk-Ewing-Utz functional were used instead). Formula (170) is new.
- (iii) The main open problem posed by Proposition 4.20, is it provide examples of unitarily invariant Euler-Legendre functions  $f \circ \lambda$  on the suitable separable reflexive spaces  $(\mathfrak{G}(\mathcal{H}), \|\cdot\|_{\mathfrak{G}(\mathcal{H})})$ . In particular, is it so for the countable extensions of functions listed in Proposition 4.17?

### Acknowledgments

I would like to thank Francesco Buscemi and Marcin Marciniak for hospitality, as well as Michał Eckstein and Paweł Horodecki for support. This work was partially founded by MAB/2018/5 grant of Foundation for Polish Science, 2015/18/E/ST2/00327 and 2021/42/A/ST2/00356 grants of Polish National Center of Science, IMPULZ IM-2023-79 and VEGA 2/0164/25 grants of Slovak Academy of Sciences, APVV-22-0570 grant of Slovak Research and Development Agency, and FellowQUTE 2024-02 program of Slovak National Center for Quantum Technologies. Part of this research was conducted at Department of Mathematical Informatics, Graduate School of Information Science, Nagoya University, on an academic leave from University of Gdańsk.

### References

The symbol \* in front of a bibliographic item indicates that I have not seen this work. Unless explicitly stated otherwise, all citations refer to the first editions of the corresponding texts in their original language. Cyrillic Russian names and titles were transliterated from original using the following system (which is bijective due to the lack of  $\mu$  and  $\mu$  combinations):  $\mu = c$ ,  $\mu = c$ ch, x = kh, x = zh, x = sh, capitalised letters, with an exception of X = H at the beginnings of words. Whenever possible, Chinese Mandarin (resp., Cantonese) names and titles were nonbijectively romanised from original, using pīnyīn (resp., toneless Yale).
