2021/22

Čech cohomology or rel⁴ to de Rham cohomology

M-manifold

$\{O_i\}_{i \in I}$ - open cover

with multiple intersections $\rightarrow O_{i_0, \dots, i_p} = O_{i_0} \cap O_{i_1} \cap \dots \cap O_{i_p}$

multiplicative notation! ①

O^k

We consider local mappings of a fixed type T into an abelian group G

(e.g., locally smooth, locally constant, ...) \rightarrow p-COCHAIN GROUPS:

$$\check{C}^p(O; G) := \{ (f_{i_0, \dots, i_p}) \mid f_{i_0, \dots, i_p} \in \text{Map}_T(O_{i_0, \dots, i_p}, G), \forall \sigma \in G_{\sigma, i_0, \dots, i_p} : f_{i_0, \dots, i_p}(\sigma) = \sigma \cdot f_{i_0, \dots, i_p} \}$$

These form a cochain complex

$$\check{C}^0(\mathcal{O}; G) \xrightarrow{\check{\delta}^{(0)}} \check{C}^1(\mathcal{O}; G) \xrightarrow{\check{\delta}^{(1)}} \dots \xrightarrow{\check{\delta}^{(p-1)}} \check{C}^p(\mathcal{O}; G) \xrightarrow{\check{\delta}^{(p)}} \dots \quad (2)$$

with CÉCH COBOUNDARY operators

$$\check{\delta}^{(p)} : \check{C}^p(\mathcal{O}; G) \rightarrow \check{C}^{p+1}(\mathcal{O}; G)$$

$$: (f_{i_0 i_1 \dots i_p}) \mapsto \prod_{k=0}^{p+1} p_k \left(\text{Inv}^k \circ f_{i_0 i_1 \dots i_{p+1}} \right)$$

where $p_k f_{i_0 i_1 \dots i_{p+1}} := f_{i_0 i_1 \dots i_{p+1}} |_{\partial_{i_k} \cap \partial_{i_0 i_1 \dots i_{p+1}}}$

We define

p-cocycles: $\check{Z}^p(\mathcal{O}; G) = \text{Ker } \check{d}^{(p)}$ (3)

p-coboundaries: $\check{B}^p(\mathcal{O}; G) \equiv \text{Im } \check{d}^{(p-1)}$

\check{C} cohomology groups: $\check{H}^p(\mathcal{O}; G) = \frac{\text{Ker } \check{d}^{(p)}}{\text{Im } \check{d}^{(p-1)}}$

The Čech cohomology of M with values in G is the direct sum of $\check{H}^p(\mathcal{O}; G)$ over all p . (E)

Take \mathcal{D} to be GOOD \rightarrow NEED NO REFINEMENT (Cherry)!
 & locally finite (4)
 finite (i.e., each point has
 a neighbourhood that intersects
 only a finite number of the \mathcal{D}_i 's).

Let $\{X_i\}_{i \in I}$ be the associated problem
 of \mathcal{D} , i.e.,

$$(P1) \quad \forall i \in I : X_i \in C^0(M; \mathbb{R})$$

$$(P2) \quad \forall i \in I : 0 \leq X_i \leq 1$$

$$(P3) \quad \forall i \in I : \text{supp } X_i \subset \mathcal{D}_i$$

$$(P4) \quad \sum_{i \in I} X_i = 1$$

(These always
 exist on C^2
 manifolds.)

For $\begin{cases} T = \text{"locally constant"} \\ G = \mathbb{R} \end{cases}$,

(5)

we have $\check{H}^p(\mathcal{O}; \mathbb{R}) \cong H_{dR}^p(M; \mathbb{R})$, induced

from $\omega : \check{C}^p(\mathcal{O}; \mathbb{R}) \rightarrow \Omega^p(M) : f \mapsto \omega_f$,

where

$$\omega_f := - \sum_{i_0, i_1, \dots, i_p} f_{i_0 i_1 \dots i_p} X_{i_0} dX_{i_1} \wedge dX_{i_2} \wedge \dots \wedge dX_{i_p}$$

NB: Outside $\mathcal{O}_{i_0 i_1 \dots i_p}$, $X_{i_0} dX_{i_1} \wedge \dots \wedge dX_{i_p}$
vanishes \Rightarrow this is well-defined
(we may extend arbitrarily)

We calculate

$$d\omega_f = -\sum_{i_0, \dots, i_p} f_{i_0, \dots, i_p} dh_{i_0} \wedge \dots \wedge dh_{i_p} \quad (6)$$

$$\omega_{\text{top}}^f = \sum_{i_0, \dots, i_{p+1}} \sum_{k=0}^{p+1} f_{i_0, \dots, i_{p+1}} h_{i_k} dh_{i_0} \wedge \dots \wedge dh_{i_{p+1}}$$

$$= \left\{ \sum_{i_k} f_{i_0, \dots, i_{p+1}} h_{i_k} = 1 \right\} = \sum_{i_0, \dots, i_p} f_{i_0, \dots, i_p} dh_{i_0} \wedge \dots \wedge dh_{i_p}$$

$$\equiv d\omega_f$$

Conclusions ..

$d \circ \omega = \omega \circ \gamma$,
or: ω is a coboundary map (7)

⇓

It induces a homomorphism
of cohomology groups.

Surjectivity: We only demonstrate
it for $p=2$.

Let $\omega \in \mathbb{Z}_{dR}^2(M)$.

\downarrow

$$\omega|_{\mathcal{O}_i} = d\theta_i, \quad i \in \bar{I}$$

$$\theta_i \in \mathcal{R}^1(\mathcal{O}_i)$$

(8)

$$(\theta_j - \theta_i)|_{\mathcal{O}_{i_j}} = d\delta_{ij}, \quad i, j \in \bar{I}, \quad \mathcal{O}_{ij} \neq \emptyset$$

$$\delta_{ij} \in C^0(\mathcal{O}_{ij}, \mathbb{R})$$

$$(\delta_{jk} - \delta_{ik} + \delta_{ij})|_{\mathcal{O}_{ijk}} = \underbrace{C_{ijk}}_{C_{[ijk]}} \in \mathbb{R}, \quad i, j, k \in \bar{I}, \quad \mathcal{O}_{ijk} \neq \emptyset$$

local constants

$$\delta^{(2)} C_\omega = 0 \Rightarrow C_\omega \in \check{L}^2(\mathcal{O}, \mathbb{R})$$

We write, as postulated,

$$\omega_{(p)} C_\omega = - \sum_{ijk} C_{ijk} X_i dX_j \wedge dX_k$$

$$\text{But } C_{ijk} = C_{jki} - C_{kji} + C_{ikj} \quad \forall R$$

over \mathcal{O}_{ijk}

$$\begin{aligned} \omega_{(p)} C_\omega|_{\mathcal{O}_2} &\equiv - \sum_{ijk} (C_{jki} - C_{kji} + C_{ikj}) X_i dX_j \wedge dX_k \\ &= - \sum_{ijk} C_{jki} X_i dX_j \wedge dX_k|_{\mathcal{O}_2} \quad \text{drop out as } \sum_i X_i = 1 \quad \text{const} \end{aligned}$$

(9)

$$= -\sum_{j,k} c_{ijk} dx_j \wedge dx_k \Big|_{O_2}$$

$$\equiv d\left(-\sum_{j,k} c_{ijk} x_j dx_k\right) \Big|_{O_2} \quad (10)$$

The same multiplied by $x_j dx_k$ yields

$$\sum_{j,k} c_{ijk} x_j dx_k \Big|_{O_2} = \sum_{j,k} (g_{jk} - c_{kij} + c_{kji}) x_j dx_k \Big|_{O_2} = d\left(\sum_k c_{ilk} x_k\right)$$

$$\text{but } \sum_k c_{ilk} x_k = \gamma_{il} + \sum_k \gamma_{lk} x_k - \sum_k \gamma_{kl} x_k$$

Therefore, it suffices to put

$$\eta_i := \theta_i + \sum_{j,k} c_{ijk} x_j dx_k - d\left(\sum_k r_{ik} x_k\right)$$

on \mathcal{O}_i

to find

(11)
 $\delta_{jk} - \delta_{kj} = -\delta_{ij}$
over \mathcal{O}_{ij}

$$(\eta_j - \eta_i)|_{\mathcal{O}_{ij}} = (\theta_j - \theta_i)|_{\mathcal{O}_{ij}} + \sum_{k,l} (c_{jkl} - c_{ilk}) x_k dx_l|_{\mathcal{O}_{ij}} - d\left(\sum_k r_{ik} x_k\right)|_{\mathcal{O}_{ij}}$$

" $d\mu_{ij}$

$$\sum_k (\delta_{jk} - \delta_{kj}) x_k = \sum_k (\delta_{jk} - \delta_{kj})|_{\mathcal{O}_{ij}} x_k = -\sum_k r_{ij} x_k = -\delta_{ij}$$

$$= d \left(\sum_k c_{ijk} x_k \right) \Big|_{\mathcal{O}_i} + \sum_k (c_{jke} - c_{ike}) x_k dx_e \Big|_{\mathcal{O}_j} \quad (12)$$

$$\equiv d \left(\sum_k c_{ijk} x_k \right) + \sum_k (c_{jke} - c_{ike}) \Big|_{\mathcal{O}_{ij}} x_k dx_e \Big|_{\mathcal{O}_j}$$

$$= d \left(\sum_k c_{ijk} x_k \right) + d \left(\sum_e c_{jke} x_e \right) = 0 \quad \checkmark$$

$$\Rightarrow \exists \eta \in \Omega^1(M) : \eta \Big|_{\mathcal{O}_i} = \eta_i.$$

Finally, we calculate:

$$d\eta_i = \omega \uparrow \theta_i + \sum_{j,k} c_{ijk} dX_j \wedge dX_k$$

(13)

$$\equiv \omega \uparrow \theta_i - \omega_{c_\omega} \uparrow \theta_i, \text{ i.e.}$$

$$d\eta = \omega - \omega_{c_\omega}, \text{ or}$$

$$[\omega]_{dR} = [\omega_{c_\omega}]_{dR}.$$

Thus, $[c] \mapsto [\omega_{c_\omega}]$
has a right dR
inverse $[\omega] \mapsto [c]$

We still need to show that (14)
 $\omega + d\theta$ yields $[C_{\omega+d\theta}] = [C_{\omega}]$

$d\theta$ has $\theta_i = \theta_j$

$(\theta_j - \theta_i) \uparrow \theta_i = 0 \Rightarrow$ we may take
 $\delta_{ij} = 0$

$\Rightarrow c_{jk} = 0$ are ok

$$[C_{\omega+d\theta}] = [C_{\omega}] .$$

But we may also shift:

(15)

$$\theta_i \mapsto \theta_i + d\psi_i$$

$$(q_j - \theta_j) |_{\theta_j} = d r_{ij} + d(\psi_j - \psi_i) |_{\theta_j}$$

we may next add $r_{ij} \mapsto r_{ij} + (\psi_j - \psi_i) |_{\theta_j}$

$$\checkmark \delta r_{ij} \mapsto \checkmark \delta r_{ij} + \checkmark \delta \psi_{ij}$$

$$+ \psi_{ij} \in \mathbb{R}$$

$$\begin{array}{c} \text{"} \\ c_{ij} \end{array}$$

$$c_{ij} + \checkmark \delta \psi_{ij}$$

\Rightarrow it is only $[C_\omega]$ that

is assigned to $[\omega]$

Conversely, let $c \in \mathbb{Z}^2(\theta; \mathbb{R})$

& consider

(16)

$$\omega_c = - \sum_{ijk} c_{ijk} x_i dx_j \wedge dx_k$$

Put $\text{int } \delta c = 0$, we obtain

$$\omega_c \upharpoonright_{\theta_i} = d\theta_i, \quad \theta_i = - \sum_{(i,j,k)} c_{ijk} x_j dx_k$$

$$\begin{aligned} & \& (\theta_j - \theta_i) \upharpoonright_{\theta_j} = - \sum_{kl} (c_{jkl} - c_{ikl}) x_k dx_l \\ & \equiv - \sum_{kl} (c_{jkl} - c_{ikl}) \upharpoonright_{\theta_{ijkl}} x_k dx_l \end{aligned}$$

$$= -d\left(\sum_k c_{jik} x_k\right) = d\left(\sum_k c_{ijk} x_k\right) \quad (17)$$

$$\Rightarrow r_{ij} = \sum_k c_{ijk} x_k \quad (\text{e.g.})$$

Es seien

$$\begin{aligned} (r_{ik} - r_{ik} + r_{ij}) \uparrow_{o_{ijk}} &= \sum_l (c_{jkl} - c_{ikl} + c_{ijl}) x_l \\ &= \sum_l (c_{jkl} - c_{ikl} + c_{ijl} - c_{ijk}) x_l \uparrow_{o_{ijk}} \\ &+ \sum_l c_{ijk} x_l \uparrow_{o_{ijk}} = c_{ijk} \Rightarrow \end{aligned}$$

One again,

$$[C_{\omega_c}] = [c]$$

(10)

other choices could connect C_{ω_c}
by str. exact!

Thus, altogether, we obtain

$$[\omega_c] : \check{H}^2(\Theta; \mathbb{R}) \xrightarrow{\cong} H_{dR}^2(M).$$

Levey!

Next, we want to understand

the relⁿ between $\check{H}^p(\mathcal{O}; \mathbb{Z}) (\equiv \check{H}^p(M; \mathbb{Z}))$ (19)

& $H_{\text{dR}}^p(M; \mathbb{Z})$, i.e., the homology

of the (co)chain complex

$$\left(\text{Hom}_{\text{Grp}}(C_p(M), \mathbb{Z}) = C_{\text{dR}}^p(M; \mathbb{Z}), d_{\text{dR}} \right),$$

INTEGRATION!

for the chain complex

$$(C_p(M), \partial_p) \quad (p\text{-chains in } M, \partial_p\text{-boundary operator})$$

Why? Because short exact sequences
of abelian groups

(2)

$$0 \rightarrow G \rightarrow H \rightarrow K \rightarrow 0$$

canonically induce long exact
sequences in cohomology

$$\dots \rightarrow H^p(C; H) \rightarrow H^p(C; K) \xrightarrow{R^p} H^{p+1}(C; G) \rightarrow H^{p+1}(C; H) \rightarrow \dots$$

FOCKSTEIN HOMO
(CONNECTING)

(at least for (torsion-)free abelian groups C .)

& we have, e.g., $0 \rightarrow \mathbb{Z} \xrightarrow{2} \mathbb{Z} \xrightarrow{\text{mod } 2} \mathbb{Z}/2\mathbb{Z} \rightarrow 0$

Back to $\mathbb{C}P^2$ vs $\mathbb{R}P^2$...

Once again, we consider $p=2$ for illustration (21)

Take an arbitrary $\omega \in Z_{\mathbb{R}}^2(M)$ & integrate it over any $\sigma_2 \in Z_2(M)$ (a closed 2-submanifold).

To this end, we tessellate σ_2 such that each 2-cell p sits entirely in some

$\mathcal{D}_{i_p} \in \mathcal{D}$, i.e., we have a map

$$\begin{array}{ccc} \Delta & \longrightarrow & I : \tau \longmapsto i_c, \\ \text{plaquette, edges, vertices} & & \\ \Delta_2 & & \Delta_1 \quad \Delta_0 \end{array}$$

so that we obtain

$$\int_{\mathcal{D}_2} \omega = \sum_{p \in \Delta_2} \int_p \omega(\theta_{ip}) = \sum_{p \in \Delta_2} \int_p d\theta_{ip} \quad (22)$$

$$= \sum_{p \in \Delta_2} \int_{\partial p} \theta_{ip} = \sum_{p \in \Delta_2} \sum_{e \in \partial p} \int_e \theta_{ip}$$

(induced orientation)

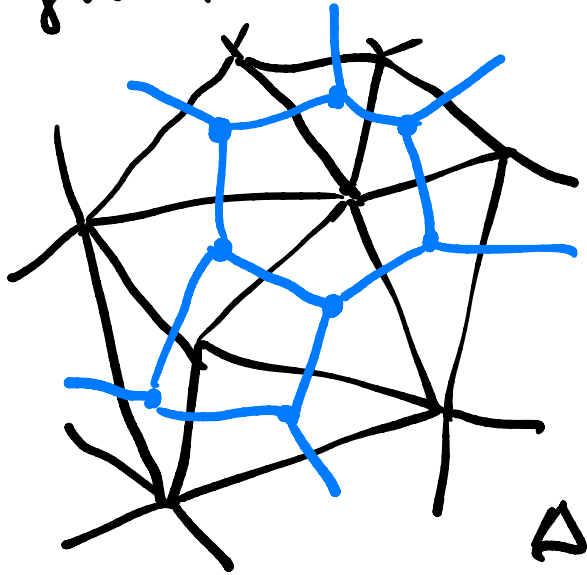

$$\equiv \sum_{e \in \Delta_1} \int_e (\theta_{i_{p_+(e)}} - \theta_{i_{p_-(e)}}) \left(\int_{\theta_{i_{p_+(e)}}}^{\theta_{i_{p_-(e)}}} \right)$$

over all induced e for $\sigma \in \partial p$

$$= \sum_{e \in \Delta_1} \int_e d\gamma_{i_{p_-(e)} i_{p_+(e)}} = \sum_{e \in \Delta_1} \sum_{v \in \partial e} \delta_{i_{p_-(e)} i_{p_+(e)}}(v) \left(\int_{\theta_{i_{p_-(e)} i_{p_+(e)}}} \right)$$

In order to facilitate subsequent analysis,
we assume Δ trivalent, which 23
can always be achieved by doubling
any given

It's clear that we end up with a sum over Δ_0 . Let us derive the precise contribution of a given vertex $v \in \Delta_0$. (24)

yields

$$\begin{aligned}
 & (\gamma_{ip_2 ip_1} + \gamma_{ip_3 ip_2} + \gamma_{ip_1 ip_3})(v) \\
 &= (-\gamma_{ip_2 ip_3} + \gamma_{ip_1 ip_3} - \gamma_{ip_1 ip_2})(v) \\
 &= -C_{ip_1 ip_2 ip_3} !
 \end{aligned}$$

$$\begin{aligned}
 -123 &= -(23 - 13 + 12) \\
 &= -23 + 13 - 12
 \end{aligned}$$

Thus, altogether, $\int_{\sigma_2} \omega = - \sum_{v \in \Delta_0} c_v i_{p_1} i_{p_2} i_{p_3}$,

& so $c \in \check{L}^2(\mathcal{O}; \mathbb{Z}) \Rightarrow \omega \in \mathcal{L}_{\text{dr}}^2(M; \mathbb{Z})$ (25)

In fact, by moving considering all 2-cycles within M , we readily recover the converse statement

$\omega \in \mathcal{L}_{\text{dr}}^2(M; \mathbb{Z}) \Rightarrow c \in \check{L}^2(\mathcal{O}; \mathbb{Z})$

Therefore, $H_{\text{dr}}^2(M; \mathbb{Z}) \cong \check{H}^2(M; \mathbb{Z})$.

The way we have constructed our reasoning,
it is clear that it generalises

to all $p \in \mathbb{N}$,

good! (26)

$$H_{\text{dR}}^p(M; G) \simeq \check{H}^p(\emptyset; G)$$

$$\simeq \check{H}^p(M; G),$$

$$G \in \{\mathbb{R}, \mathbb{Z}\}$$
